Yahoo Group Archive: icomr75 (2000 — 2002)

Yahoo Group summary: This is a group for discussions and information exchange on the iCOM IC-R75 receiver.

These Yahoo Groups messages were archived in WARC format by ArchiveTeam in 2016. This PDF was generated by Digital Library of Amateur Radio & Communications from the WARC files in 2026.

Date span: 2000-10-02 through 2002-12-31, plus 13 messages with implausible archived dates

Archived timestamps before 1997-01-01 or after 2020-12-16 are flagged as implausible and excluded from the date span; their original values remain in the message headers and manifests.

Source WARC: icomr75.6ePRedX.warc.gz

Source item: https://archive.org/details/yahoo-groups-2016-10-18T15-13-59Z-259f4e

Messages included in this PDF: 3403

Message records with no body available in the source archive: 3

Messages omitted as spam from this PDF: 1

Yahoo replaced the domain portions of email addresses with @... in the archived messages. Characters lost in Yahoo's archived text appear as ?.

Messages are presented in ascending Yahoo message-ID order. Gaps indicate records absent from the source WARC or messages omitted from this PDF as spam.

1. Welcome!

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-02 09:31:20 UTC
From: Radostin Danev
Topic: 1 Message: 1

Hi everybody,

Welcome to the IC-R75 mailing list. I hope we can exchange some useful info about this very nice receiver.

Feel free to contribute to the Files and Links sections of the list.

Best regards,

Rado

2. Just uploaded a datasheet ... synch detector improvement possible?

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-02 13:04:59 UTC
From: Radostin Danev
Topic: 2 Message: 2

Welcome to the first members!

I've just uploaded the datasheet of the MC13022 - stereo AM circuit used in R75 as synchronous detector.
Maybe there are some improvements possible to the non-functioning S-AM.
What's interesting ... I found a web page:

http://user.netonecom.net/~swordman/Radio/ShortWaveRadio.htm

with this interesting info:

" ...FAR Circuits has a $5.25 board for the Sync Det in the Fall, 1994 Communications Quarterly 13-page article by Scott Prather, KB9Y entitled "A Unique Approach to AM Synchronous Detection." It uses the Motorola MC13022 AM Stereo Decoder chip, a 4066 I.C., 2 transistors and an LM311 Audio Amp I.C to drive the speaker. He says that the receiver must be very stable ..."

Could somebody find this article and see what kind of synch detector is described there? I don't have access to the "Communications Quarterly" magazine here in Japan.

Best regards,

Rado

3. I wrote to the owner of the web-page

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-02 13:21:56 UTC
From: Radostin Danev
Topic: 3 Message: 3

Hi again,

I wrote an e-mail to the owner of the web-page in my previous message asking
him to help get the article. Telling this in order to prevent everybody
sending him an e-mail about this article.

I really have some hope about the S-AM ... if nothing else it is very easy
to make the R75 receive stereo AM :-)

Best wishes,

Rado

4. Some observations

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-03 00:58:07 UTC
From: Radostin Danev
Topic: 4 Message: 4

Hi again,

Yesterday evening I've played a little with my R75. What I think is that the synch is locking properly (the IC has internal VCO) even on very weak signals. The problem is with the demodulation. It is not using a product detector?!?. The output used for S-AM is marked as "I Det." somebody has any idea what that "I" stands for? There is also a "Q out" pin ... could that be for "quadrature"?

Otherwise I'm very happy with the R75. Very smooth and open receiver. I have the FL-257 (455kHz IF 3.3kHz BW/6dB) which makes for a nice bandwidth between the 2.4 kHz and 6 kHz.
When listening to rapidly fading AM signals I find the AGC action a little bit fast. I use the "RF gain" to fix the gain and this reduces the effect of the fading.

Somebody else willing to share some experience?

Best regards,

Rado

5. r75

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-03 03:10:16 UTC
From: Gert Nilsson
Topic: 5 Message: 5

My R75 gas the 2,8 and 3,3 kHz filters. Very nice for ecss operation. I have the same experiences of the SYNC AM mode. It locks within 3,5 kHz with the 6 kz filters. Selectable sideband is possible with the PBT and 2,4 or 2,8 kHz bandwidth. However distortion is not lower in SYNC AM. Seems to be some problems with the AGC or detection.

6. Greetings

Yahoo group: icomr75 (2000 — 2002)

From: Ken
Topic: 6 Message: 6

Hi...

Just joined the group and am looking forward to it. I have an R-75 amongst others and use it mostly for utility listening. Sync isn't a factor for that :)

Ken

7. Filter calibration

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-05 11:42:12 UTC
From: Gert Nilsson
Topic: 7 Message: 7

In the Service manual to the R75 you can read about the filter calibration possibility. It is not clear what frequency should be used and what is the object of this calibration. Perhaps compensation for different attenuation in the filters or adjustment of the BFO frequencies? I need some more information because I have some plans to change the CFJ455K5 2,4 kHz filter with an old FL44A.

8. About the files section

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-06 00:48:34 UTC
From: Radostin Danev
Topic: 8 Message: 8

Hi R75-ers,

Some of you may think that the files I've uploaded in the Files section are taken from the service manual thus making the publishing illegal. This is not the case - I've taken them from the FCC website:

https://gullfoss.fcc.gov/cgi-bin/ws.exe/prod/oet/forms/reports/Search_Form.hts?mode=Edit&form=Exhibits&application_id=93475&fcc_id=AFJIC-R75

(the URL should be on one line)

So they are already made public - i.e. distributing them is not illegal.

Today I'm going to post a synch mod for the R75 making the synch really useful.

Best regards,

Rado

9. Synch mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-06 08:09:37 UTC
From: Radostin Danev
Topic: 9 Message: 9

OK ... after some research and experimentation here's the fix for the synch.

The problem is two fold - 1st the stereo IC used as synch detector is not implemented properly. The pin 23 (blend) is grounded in the ICOM's implementation. This puts the IC in "tuning" mode which means fast lock and fast AGC. The fast lock and AGC causes the VCO to lose lock in each fade out thus making the synch unusable. What I did was to peel off pin 23 from the PCB with the help of a very small screwdriver. Then I put the missing cap between it and ground. I used 47uF cap (in the datasheet they show 20uF) - the larger value makes for more stable operation - increases both the lock and unlock times.
The second problem is with the AGC. Maybe some of you have noticed the annoying oscillations with rapidly fading stations making the AM mode unlistenable. This comes not from the receiver's AGC (I've checked the schematic and it is identical to that of the IC-756 transceiver ... which has very nice AGC action in AM). On top of the receiver's AGC the AGC of the stereo (synch) IC (MC13022A) is added. The IC's AGC is very fast (this IC is not designed for HF operation - it is for strong stable AM BCB stations) thus distorting the AM signals during fades. The fix is to connect a large cap (I used 1000 uF) between the AGC pin (4) and ground. This effectively turns off (makes it VERY slow) the AGC of the IC. This also helps for the synch to keep lock.

After two days of use with the above modifications I can say that now the R75 is a very respectable in the AM department. Signals previously unlistenable in AM are now clean and distortion free. The synch removes the selective fading effects and with weak stations improves the signal-to-noise ratio.

I want to test the mod some more and then I'll provide more detailed explanation accompanied with pictures.

As a start you can try only the AGC mod - take a large cap (like 470 uF or more) connect one end of a wire to ground and the other end to the neg.(-) leg of the cap. Tune a rapidly fading station in AM. Touch the pin 4 of the MC13022A IC (it is a 28 leg IC to the left of the 455 kHz IF filters when the front panel is facing you) with the positive (+) leg of the cap. First the signal will disappear for a short time until the cap is charged. After that you'll get a much smoother signal than before the cap.

Best regards,

Rado

10. New URL in the links section

Yahoo group: icomr75 (2000 — 2002)

Hi,

I've added a new URL to the Links section - it Gert Nilsson's DX-ing page.
He has a comparison between the R75 and R71E.

Check it out!

Rado

11. New Owner comments

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-09 11:55:48 UTC
From: jrev@ev1.net
Topic: 11 Message: 11

Just picked up an R75 at a hamfest for $325. Radio was still
in box and has low usage. Haven't finished the manual yet but have
done some listening.

This one has no DSP option installed. I may try calling Icom later
today and see if they will sell me the option at a decent price. (the
$140 price tag is hard to handle since I already have many Timewave
external filters sitting around) Any comments? Should I just use
one
of the external Timewaves or go for the internal DSP?

I should not judge yet, but I couldn't help make a few quick
comparisons to my R71A. I was surprised that the 75 seemed to be a
little more sensitive (should I have been surprised?). Of course it
had to sound better than the 71.....nothing could sound
worse.....well
almost nothing, my NRD525 is almost as bad as the R71. Of course the
real test (for me) will be how it compares to my R5000. I have found
no other radio that sells for under 1200 U.S. dollars that in
"totality" (overall...all things considered) can match an R5000 with
a
good DSP unit attached.

Thanks for this message board...and all the files! Took advantage of
them already.

I have the DSP option. I am not very impressed by the noise reduction, but I think the automatic notch filter is very good. Just press the button and the heterodyne disappears. It can remove several tones simultaneously. However it covers just something like 250 - 2500 Hz, frecuencies used in the audio by amateur radio stations. Other tones has to be removed by the PBT.

I think the DSP works pretty well. Cuts out a little too much signal, and you can't set it very high, but it does work pretty well if set at the right level.

14. Fineware's RLDB problem

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-10-10 12:20:15 UTC
From: Radostin Danev
Topic: 14 Message: 14

Hi all,

I see Mark Fine has subscribed to this group so I'm going to ask this question here as the answer could benefit all the members.

First some comments:

I'm currently trying the shareware version of "Smart Icom Control" and it's working very good. It would be very nice if one can import not only the SWBC files but also something like ILG directly into it. This will make the logging a snap.
I use ILG database constantly and now my configuration is:
- GNPB software for the ILG database
- Smart Icom Control for the logging

This makes for a not so convenient setup - I look the freq. in the database then I tune the receiver (either manually or through the SIC) and then log. The logging involves entry of the station info. If the ILG was imported directly into the SIC this will become the ultimate logging system - click on the station to tune, press the log button and enter only SINPO and Notes.

The problem with the RLDB:

I tried to install it on my notebook computer at home (Win98). When I try to start it up an error message appears: something with "Socket Error" in it. I don't have network card or modem on my notebook (so no drivers and network protocols installed) - is that the problem? The RLDB software starts and works flawlessly on my NT machine at work - it has network and all. I want to use the RLDB instead of the GNPB because it can tune the R75 (but no logging ... how about logging in the final version?)

I think the Fineware's software is a very good package ... the best for R75 currently available. ... my only wish is to be able to import ILG database into SIC. (or to have logging in RLDB)

Thanks Mark for your efforts to improve the hobby!

Best regards,

Rado

P.S. I forgot that maybe most of the people use their R75's mainly for utility monitoring ... OK I'll start a poll in the Polls section.

Wonder if Mark is a member here? If so, pay attention to his answer and not mine :)

I believe you're right about the problem with RLDB.. it's looking for a network socket. Although I've been able to run it on my machine without internet access. Might have to have explorer and dial up networking installed, even though you won't be using them.

Smart Icom has a fairly good database installed of english language transmissions. Granted, it doesn't address ALL of the broadcast stations, but it is fairly extensive if you keep up to date with the schedules software. Once you figure out what's going on with RLDB, you should be able to control your receiver, although it's not as complete as Smart Icom.

Good luck!

Ken

> files but also something like ILG directly into it. This will make the

Version 4 of all of the Smart Control series is planned to be ILG-capable, as well as include some other features that are found in RLDB. Bernd has been pretty elusive with me, so this may take some time. If anyone remembers the debacle on rec.radio.shortwave a few months ago... well... I'd rather not go there again.

Glad you're enjoying the logging feature. Sounds like you're using it exactly as it was designed.

RLDB:
> I tried to install it on my notebook computer at home (Win98). When I try to

Yes, you need some kind of internet connection set up. This has something to do with a bug within some third-party software modules that are included to handle the internet updates. I believe that if you install dial-up networking (even if you don't use it) it will then work correctly.

> Thanks Mark for your efforts to improve the hobby!

You're welcome. Likewise, good luck with the list.

Also want to take the time to publicly thank Ken for his outstanding article in PopComm. However, I do want to take the time to point out a minor drawback in RLDB is that it expects the R-75 to use the default address of $5A, at a port rate of 19200. And while I'm bashing my own stuff: In Smart Icom, I also owe a few people a squelch control, which I hope will be included in a minor upgrade before v4.<G>

A lot depends on things that I don't have much control over. For example,
working the issue with Bernd. The rest depends on the spare time to get it
done.

Version 4 is going to be a major undertaking and almost a downright re-write.
The majority of this is necessary to alleviate the "heaviness" of the code,
and to make all of the Smart series more common, interoperable and less
resource hungry.

Realize this is not really an answer, but the bottom line is that it's gonna
take a while to do it right.

Thanks, Rado - I am keen to see the fixes you are recommending (they sound like an excellent way to make this receiver first class in every respect).

The R75 I recently bought doesn't have the DSP filter installed. I currently use an external Timewave DSP-9 with it.

Would it be worth the expense to order the DSP for the radio or am I already using a better DSP unit? Opinions???

28. Re: FL-103?

Topic: 25 Message: 28

I think the FL103 is a very good filter. I use it for ECSS reception of AM stations. I also have the 3,3 kHz 455 kHz filter in series with the 2,8 kHz and this is really great. The 455 kHz filter has steeper skirts. If I had to choose just one extra filter my choice would be the 2,8 kHz 455 kHz filter despite the extra cost.

From: Mark
Topic: 30 Message: 30

Hi,

I have a question about the filter settings of the R75.
I listen to broadcast stations (no UTE or amateur), and I use USB most of the time. In the normal filter settings, I set the 455 kHz. IF filter to 2.4 , and the 9 mHz IF filter to 15. This seems to work nice most of the time. But when I set both to 2.4, I notice a difference in audio between LSB and USB. LSB sounds much more 'bassy', and USB sounds more like a phone. I wonder if this is normal.

This is absolutely normal. You have to adjust the PBT in order to get the proper setting. The BFO is correct only for the 2,4/15 kHz choice of filters. BFO is not calibrated the same way as on the 7030!

The FL44A seems to be the best choice available. Let us know how it
fits. (The CFJ455K5 sounds more like a 2.8 kHz bw filter). Do you
have any plans on swapping out the 15 kHz and 6 kHz filters? It
seems
to me that the 6 kHz (450kHz IF) filter is more like a 7-8 kHz bw and
is OK for FM. If only one could find a descent 5 (4.8?) kHz (450kHz
IF) filter to swap for the 15kHz filter.

I have measured the CFJ455K5 in my R75 to 2,4-2,5 kHz with a 1:1.7 shape factor. The 6kHz filter is 7,3 kHz at around 1:2. I have used the CFJ455K5 in an old R390A, with a bandwidth of 2,7 kHz filter. I am not quite sure but I think this filter is used in the AR7030 as well. I have also tried a CFS455J in my R71. A good filter with a 3,8 kHz bandwidth. But..... I can´t find a good 450 kHz for wide AM! I have the 3,3 kHz filter but I think 4-5 kHz would be good for AM/AM-S.

AM/AM-S.

The CFJ455K14 comes as stock in the AR7030 Plus. In the AR7030 Plus
that filter has a narrower bw (2.1 - 2.2) than the CFJ455K5 (2.5 -
2.7).

If I can. I may have to add an "outboard" addition to the main program to
accommodate all the "knobs". But it can be done.

Can anyone answer this question, I haven't checked the manual, yet. But, I feel that the other R-75 users have a better reference than the manual. Will the FL-102 plug into the 9 MHz socket and will the setup accept this filter in the program? I am considering a pair when I can afford them; the FL-257 and the FL-102.
Tnx,
Sonny, K4WYS

-----Original Message-----
Subject: ICOM R-75 Synchronous Detection Fix
Hello ICOM Tech. Support,

-I am considering buying an R-75 but have heard on the internet about the problems that are inherent in the R-75's AM synchronous detection operation.
-Mainly that there is no difference with it turned on.
-There is a person (Radostin Danev) that has provided a modification to improve the operation of the Sync. Detector.
-Are you aware of this and is there a service bulletin on this or other improvements ?
-I just would like to know before I purchase an R-75 and modify it , possibly voiding it's warranty.

Thanks,
Eddie Bryant
N4UMJ

-----Response from ICOM-----

Eddie,

There are no mods from ICOM for the IC-R75 synchronous detection. If one chooses to modify the radio it is O.K. as long as you don't destroy the radio in the process.

Best regards,
Orien, KJ7ZT
ICOM Technical Support

Group Members,

Looks like it's OK to do it as long as you don't butcher the radio in the process.
Also remember to use a static strap when working on the sensitive nature of electronics contained within the R-75.

Now to sell a few things around the shack in order to buy my R-75

Eddie Bryant

Hi Charles,

> Looks like it's OK to do it as long as you don't butcher the radio in
> the process.

That's good news and good company policy. I'm thinking of sending the mod info to the headquarters of iCOM in Japan. Not sure if it's worth however - maybe no one will even look at it.

> Now to sell a few things around the shack in order to buy my R-75

You won't regret getting R75 - it's an excellent receiver in my opinion.

Best regards,

Rado

48. Synch. mod sound sample uploaded

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-06 04:47:02 UTC
From: Radostin Danev
Topic: 48 Message: 48

Hi,

I've just uploaded an audio sample of the synch. detector mod - folder "Audio". The file is stereo - R75 in the left channel and SONY ICF-SW07 in the right (sorry this is the best radio I have besides R75). See the text file for details.
I'll post the updated version of the mod (Ver. 1.1) as soon as I find some time to format it - before the end of this week I hope. It makes the synch. very stable - for a small price of hearing whine for 1-2 seconds before its locked (it slows down the lock - delock). Once locked it's rock-stable.

Best regards,

Rado

49. Polls

From: W. R. Hood
Topic: 50 Message: 50

I see that Rado is very active in the R-75 group. I like his mod. for the S-AM, but I have not attempted it yet.
My use of the R-75 is for the local broadcast station listening and to monitor the AMers on 3885 and 7295 and back up my IC-756Pro and IC-756.
I have the RS-75, computer program and it works fine. I would like to see another software program that gives me a fully active panoramic display as the 756's do. It would be nice.
KEEP UP THE TECH information on the R-75, it's great.
Sonny, K4WYS

Dear John and other R75-ers,

I'm awfully busy lately so was not able to post the Ver. 1.1 of the mod. I'll explain it briefly here:

- Perform mod Ver. 1.0
- Solder one end of a wire to Pin 3 (REF 3.0 V) ... Pin 3 is next to Pin 4 (AGC). The third pin from left on the bottom side of the IC (see the description of mod Ver. 1.0)
- Solder a resistor with a value around 12 kOhms on the other end of the wire from Pin 3. (I used two resistors in series 10 kOhms + 2.2 kOhms). The value of the resistor I determined by soldering a 50 kOhms pot and then found the best performance position.
- Solder the other end of the resistor to the joint between the wire from Pin 23 (Blend) and the positive leg of the 100 uF cap. The joint will then be: wire Pin 23 + 12 kOhms resistor from Pin 3 + positive leg of a 100 uF cap.

I'll try to post Ver. 1.1 with pictures till the end of this week - but no guarantee. (I have to open the R75 and take the pictures of the update yet)

John, I'm happy the mod works for you. If you want a very stable synch detector I recommend you to perform the update to Ver. 1.1. It will produce a lot of whistles however if you are tuning in S-AM mode (in order to be stable the lock speed is reduced).

Best regards,

Rado

53. Select Memory Scanning

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-16 19:45:16 UTC
From: kf4gnl@yahoo.com
Topic: 53 Message: 53

If anyone else has had trouble with the "Select" memory scanning on the R-75, here's a solution. Apparently, ICOM did not complete the instructions for this in their U.S. Owners Manual. After programming about 50 or so frequencies into the memories, it seemed to make no difference whatsoever whether a memory has been "Selected" or not. The scan will stop on any memory when a signal is detected.

After contacting ICOM about this problem via the rather circuitous route of going through the Compuserve Hamforum, here's what they had to say about the R-75.

To scan only the memories that you have selected, press the SEL button after you press the SCAN button. This puts the R-75 into the Select Memory Scan mode. It makes both the S next to the memory number and the SCAN symbol flash simultaneously. ICOM left this out of the U.S. Owners Manual. Just thought I'd let the other R-75 owners know about this.

54. R75 or AOR 7300+

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-18 03:24:56 UTC
From: noel@oisin.demon.co.uk
Topic: 54 Message: 54

I am faced with difficult decision. I can either go for the extended coverage of R75 and gain a simpler control layout but lose decent S-AM, or I can opt for the AOR 7300+ with its menu-driven control system, more restricted coverage range and superior (apparently) S-AM.

I am going to be limited to using a relatively small (active) antenna, as I'm an living in an apartment (condo), so I'm at bit of a loss to tell which receiver is best for this setup.

I would welcome any thoughts from the group, even though I'm sure they might be just a bit biased :)

I would also like to hear any comments on the Sherwood SE-3 aftermarket mod to give the R75 decent sync detection.

By the way, I'm UK based, so that makes quite a bit of difference to the prices (we usually have to pay a lot more)

Many thanks in advance,

Noel

Hi Noel,

I was in the same situation 2 months ago. Finally I decided on the R75. Now I'm even more convinced I've made the right decision. The synch. mod makes the S-AM working. I've never used an AR7030 but I expect it'll have only a slight edge over the modified R75 (if not equal). On the other hand R75 is much better in ergonomics - big display, dedicated controls etc. I also live in apartment and use a SONY AN-1 active antenna. In this situation the noise floor is the limiting factor while DXing. Finally the price of the R75 is about one half of that for AR7030 (I don't know how the things are in UK though).

This is only my opinion so put all pros and cons on your balance.

Best regards,

Rado

56. ICOM R-75 Price Reduction

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-18 04:54:15 UTC
From: Charles Bryant
Topic: 56 Message: 56

I am proud to say I finally ordered my R-75 today from Ham Radio
Outlet when I learned of the great deal ICOM is presently offering.

They are offering $200 (Coupon)off the list price plus a free UT-106
DSP too!

This put the purchase price right at $584.95

I was waiting for some of my other Amateur radios I have listed to
sell but after
finding out about this today I could not pass up the deal.

I will probably do the Rado Sync. Mod discussed here on the group
after I have used it for a while and am confident that the new radio
is working normally.

Look forward to using it and sharing
my experiences with the group,
Eddie Bryant
N4UMJ

I think you mean AOR 7030+ rather than 7300+? Anyway, my comments below assume that, sorry if I made the wrong assumption.

Noel said....

I have an R75 and an AOR7030+ right here. I originally had a similar decision to make, bought the AOR7030+ first then later bought the R75 too.

I think you've hit the nail on the head re. the differences....

S-AM on my (unmodified so far) R75 is in my opinion useless. So far I've not found any signal that was improved by turning on the sync. S-AM on the AR7030+ is very good, though it's the only radio I've had with a working S-AM so I don't have anything else to compare it to.

Driving the R75 is a fair bit easier than the AR7030+ but you can make up a lot of the difference by setting memories on the AOR to things you use most often such as in my case 3.8MHz LSB, 7.1MHz LSB, 5.68MHz USB, other amateur band edges, etc. so that I can jump easily to the places that I most often start tuning from. The one thing that keeps catching me out on the AOR is that I can't see at a glance what pre-amp, attenuator and filter settings I have but on the R75 it's all right there on the big clear display.

The coverage on the R75 is wider, but in practice that doesn't matter much to me as I don't tend to listen to things between 30 and 50MHz and I have other radios with that coverage anyway.

One thing you didn't mention but which I find fairly important is the "feel" of the main tuning knob. The AOR7030+ has a nice weighty control that spins very freely and just feels right, whereas the ICR75 has a plastic control that is noticably stiffer to turn and doesn't have a comfortable place for my thumb. This matters to me as I spend a fair amount of time just tuning around, especially on the amateur bands. Whether you're a "type it in" sort of person or a "twiddle to it" person will probably go a long way towards making your choice for you. Talking of tuning knobs, I had an AR7030 (not plus) for a few days and the tuning knob on that was very poor, missing many increments and often tuning in the wrong direction. Apparently that was a common failure mode on the non-plus mechanism, but mine was faulty right out of the box.

In terms of ability to receive signals there's very little difference on SSB but the AOR beats an unmodified R75 on S-AM.

I find the twin pass-band tuning of the R75 easier to use than the if-shift approach on the AOR7030+, but that might be just because the knobs are right there all the time rather than hidden away in a menu somewhere so I tend to use them more.

> I am going to be limited to using a relatively small (active)
> antenna, as I'm an living in an apartment (condo), so I'm at bit of a
> loss to tell which receiver is best for this setup.

I feed both my receivers at the same time through a Wellbrook 4 way passive HF splitter, a slightly custom built one that has two aerial inputs on a switch rather than the usual one. On one input I have a Wellbrook ALA1530, on the other a wire dipole cut for 40m and draped over the bungalow roof and back garden. The loop beats the wire almost all of the time in terms of clarity of signal rather than s-meter reading, but the wire is less noisy on 80m sometimes.

I did try the loop inside before installing it at ground level up the garden and it did perform reasonably well, but was *much* better once outside and away from the noise field of the house.

> I would welcome any thoughts from the group, even though I'm sure
> they might be just a bit biased :)

I'd like to think I don't have any bias between these two radios as I have both. I'm probably biased in favour of these two rather than all the others out there though as I may be subconsciously justifying having spent the money on them. :)

If you have any questions about either or both of these radios while you're trying to make your decision please shout up and I'll try to help.

> By the way, I'm UK based, so that makes quite a bit of difference to
> the prices (we usually have to pay a lot more)

Me too. I bought both from Waters and Stanton, partly on price but mostly because they're the nearest to me at an hour away by car and I always get good service from them. I've also had very good dealings with Martin Lynch and Sons and Nevada.

One thing to watch.... there are sometimes offers, either by the dealer or the manufacturer, where they will throw in something for free that's normally an optional extra. Make sure you ask your dealer whether there are any current offers or if they know of any in the near future. When I bought my AOR7030+ it was just 2 weeks before an offer (which I didn't know about at the time) started where AOR threw in a free filter. W&S did sort it out for me though and got the 2.4kHz SSB filter from AOR for me but it would have been a lot less hassle if I'd checked for offers first.

I don't know where in the UK you are, but if you can get to London easily you might want to have a wander around the Picketts Lock amateur radio fair next weekend. All the big dealers will be there and you should be able to have a good look at each of your choices.

Cheers,

Mark.

Charles,

Congrats on finding such a good deal.

Re: the AM-Sync. mod...I have performed the original mod as per Rado and I have found it to be extremely useful. I find I can ID stations that would otherwise have been impossible. I have, for the first time, attempted to post some of my loggings, (R. Aparecida, Brazil, 11/16/00, 0708 on 11.855...Radio Rebelde, Cuba, 11/17/00, 0734 on 5.025). Unfortunately I believe there may be or had been a problem w/ the reflector, so they may not have been posted.

Good luck w/ the new radio..I'm sure it will give you years of good listening.

John Schneider

Hi Mark
I have added the UT -106, its really mandatory to have ,it works favourably,your lucky a price reduction plus the UT-106 thrown in free !!!!!! well its because you probably live in the States, I live in Canada and we where told that we could not have a DSP-106 free with our purchase , thats discrimination and does not hold water with us Canadians! if ICOM says that ICOM CANADA IS different from ICOM AMERICA " its a load of cods wallop'' !!!!!!!
In fact ICOM should have sold the R75 complete with the UT-106 included to the whole world over !!its like selling a car with no brakes !!!!!!! ICOM has lost a lot of goodwill over that one . and now we have one of our members fixing the AM Synchronous Detection for them !!!!!!!!!!!!! as far as Ime concerned
I am sorry that I purchased the R75! THEY SHOULD ALL BE RETURNED TO ICOM AT THEIR EXSPENSE TO BE FIXED !!!! and dont put any more on the market until they have fixed the problems
Regards
Tony

Passport to World Radio gives it glowing review, apart from the
ergonomic issues, the menu system.

>On the other hand R75 is
>much better in ergonomics - big display, dedicated controls etc.

True, and it covers up to 60MHz.

>I also live in apartment and use a SONY AN-1 active antenna. In this
>situation the noise floor is the limiting factor while DXing.

I currently use the Sony AN-LP1 with a Sony ICF-SW 7600G. I'm not
sure how I would go about making the Sony antenna usable on a proper
communications receiver, as the antenna connection is a mini-jack.

>Finally the price of the R75 is
>about one half of that for AR7030 (I don't know how the things are
>in UK though).

The price of the AOR 7030 is about the same as the ICOM R75, the
7030+ is about half as much again. It's the plus version I'm looking
at.

Regards,
Noel

I have working S-AM on the Sony 7600G and it works well, even if the remainder of the 7600 is a bit lacklustre.

>The one thing that keeps catching me out on the AOR is

That's an important consideration. I had heard that there were problems with the 7030 tuning knob and that it was prone to failure. Perhaps they have fixed that. I

>This matters to me as I spend a fair amount of time just tuning
>around, especially on the amateur bands. Whether you're a "type it

My job requires me to be a 'type it in' type person (I spend most of my day using a keyboard), so a opportunity to avoid a keyboard would be nice.

>I don't know where in the UK you are, but if you can get to London

Hello Tony,
Greetings across the border !
- On the discussion of the Icom R-75 ,I agree that the ICOM should come
with the
UT-106 DSP included for all countries. I suspect when they design the
radio
they are given a certain price guideline to stay within. Adding that DSP
as
an option keeps them within it and gives ICOM an edge in that it can be
added
later on. I sold my last audio DSP(NIR-12) It really had some strange
artifacts that
I did not like. I would rather listen to noise. Hopefully the Icom is
better.
- And also it would be the proper thing to do if ICOM acknowledged they
have a
problem with their AM Sync. Detect design.
- See my earlier posting on Icoms' response(10-28-2000.)
- I take it for granted, being able to pop the lid and snip or solder.
But, not everybody has that capability or knowhow.
- ICOM has repaired other fixes on Amateur Radios in the past so maybe
they will
provide a fix for this eventually.
- I suspect there probably is a new R-76 (Upgraded R-75) around the corner
anyhow.
- I had the same problem with my original ICOM Amateur Radio 706.

They have put out four versions (I think) in the last couple of years. Each time improving
their design and fixing the faults. Meanwhile I have an original radio I paid $1200 (USD)
for what is worth now maybe $500 (USD)because nobody wants the older model when
they can buy a new and improved one.
Rather than take a $700 loss I am hanging on to it and I have hard feelings about that too.
- Why not come out with a unit that has it all and be done with it.
- This is almost equivalent to selling the public an ongoing prototype.
- This is OK if your on the tail end and buy last (get the most features for the least $)
- Wait long enough and they will change it or dump it.(Radio Churning !)(Not to be
confused with Computer Churning !) : -)

I am more satisfied with ICOM than dissatisfied but there is certainly room for improvement
here. Kenwood seems to have dropped behind in their Shortwave competition with ICOM.
Of course Kenwood had their problems too, including radios with a certain glue that ate
away over the years at the electronic components in the VFO section of the radio.
Then one day your radio failed to operate. Design flaw and expensive surgery here for
the owner.

I discussed this with a technician once and he called the ICOM radios I had " toy radios."
He was comparing my radios to the more expensive ($3000 plus)top of the line units such
as the Watkins-Johnson's and others. It's all relative I guess.

Take care,

Eddie Bryant

Hello Mark,
I will give you my opinion when I receive the radio and
learn the ins and outs of it.
I previously owned a JPS NIR-12 outboard audio DSP.
This was a very expensive unit with dual processors.
I just could never get it to sound to my liking so I sold it.
I really would rather hear the noise than put up with the
strange processed sound.
Although I must admit the auto-notch worked great.
I mainly used it for voice. It probably was worth its weight
in gold for the CW enthusiast and picking out those individual
signals.
I also am looking forward to having this unit in the radio
instead of in a seperate box.

I will keep you updated,
Eddie Bryant

I tried one a friends outboard DSP for a while, I forget the model but it's the MFJ that everyone raves about. Whilst it was impressive, I couldn't make it do anything better than a piece of Windows shareware called Chromasound. It would be nice to have a decent DSP inside the radio though.

Cheers,

Mark.

The IC-R75 only whetted my appetite for SWBC and utes, I needed something a little more suitable to the task, so a surplus Racal RA6790/GM is on its way here, in a couple weeks. The R75 will serve nicely for SWBC and AM BCB DX'ing, I'll let the Racal handle the heavy lifting... An old but still great working WJ 340-A7 handles the 1 to 900 KHz spectrum.
Maybe someday, a WJ 8617B to cover up to 1GHz, may be in the tea leaves.

Even the venerable Sony ICF-2010 has far better AM-Synch detection than does the R75, and one can even select which sideband. It's still about the best bang for the buck for under $400 (or even $500).

Hi,

I have both the R75 and the AR7030+.

R75:
I find both the number of filter positions and the choice of filters
for the R75 rather limiting. Besides the stock 15kHz, 6kHz, and
2.2kHz, I had the FL-103 (2.8kHz) and the FL-257 (3.3 kHz) installed
in the radio (I removed the FL-257 and had it installed in the
AR7030+). I did not find the optional filters useful for listening
in
AM mode: there was a loss of volume and the optional filters were
too
narrow for AM -- plus it was annoyiung to have to always play with
the
tuning dial or the PBT to get it to sound "right". Listening to AM
signals in "ECSS" mode worked OK on the R75, but it's much better on
my AR7030+. As far as sensitivity goes, the R75 is not all that bad
but I can pick up signals on my AR7030+ that I cannot on the R75.

As for the DSP, I find the NR on the R75 relatively useless, since both signal and noise appear to be reduced proportionately. Although I have never had occasion to take advantage of the noise blanker (NB),
I am told that it works very well. The only thing useful to me (as far as the DSP is concerned) is the automatic notch filter. This seems to work well but unfortunately it is not tunable. As you heard,
the S-AM on the R75 does not work (at least not until you perform Rado's mod).

AR7030:
I have the following filters installed in the AR7030+: Kenwood YG455C1 500 Hz, XTAL 2.4 kHz, Icom FL-257 3.3 kHz, Collins 4.0 kHz, and Collins 6.0 kHz. The radio measures them as 700, 2.2, 2.8, 3.5, and 4.6 respectively. The XTAL 2.4 is really great on true SSB signals. The FL-257 is excellent for listening to AM transmissions in ECSS mode. The Collins 4.0 (3.5) is best for listening in sync mode when selecting a sideband, while the Collins 6.0 (4.6) is best for double sideband sync mode. I haven't made much use of the 500 Hz filter yet. The AR7030+ has great dynamic range, something the R75 doesn't have. I also find the AR7030+ to be more quiet. I prefer the PBS on the AR7030+ to the twin
PBT on the R75. The sync detector on the AR7030+ works well and it's a particular joy to be able to use it while selecting a sideband or anywhere in between the sidebands. Also, my AR7030+ is spot on when it comes to the frequency display. The R75 is not, and this can be a bit annoying when it comes to tuning in SSB modes. On the negative side, I have noticed that when using the AM envelop detector on strong
MW signals, there is some distortion. The distortion is alleviated somewhat by using the attenuator and/or tuning off center and/or using the PBS. In any case, the distortion disappears in sync mode. Before acquiring the radio, I was somewhat worried that the menu system would be difficult to use. However, to my surprise, I find it rather easy to use. I am still waiting for the noise blanker option so I cannot comment on that.

I believe that my R75 cost me about one third of what the AR7030+ cost
me. So the R75 is a good value (especially for SSB).

On several occasions I've tuned my AR7030+ and my ICR75 to the same station so that I can make comparisons between them and I've never noticed any difference in frequency readout or SSB pitch for a given frequency.

> I believe that my R75 cost me about one third of what the AR7030+
> cost
> me. So the R75 is a good value (especially for SSB).

100% agreed. Before I bought the R75 I was expecting it to be significantly less of a performer than the AR7030+ but when I got it I was pleasantly surprised. Ok so if you try hard to pick the better one the AR7030+ probably wins for most people, but the R75 isn't far behind and I reckon it's excellent value for money.... unless your main interest is AM and you don't want to do the mod to make it actually work.

Cheers,

Mark.

I too am a Canadian but I got my R75 from an American dealer when it first came out. At that time there was a 100USD coupon and another coupon to mail in to Icom America to get the free DSP. Icom America honoured the DSP coupon even though I am not a US resident (I also checked with them *before* making my purchase).

I recenltly got into SW and found this reciever had great reviews except for the S-AM. I'm happy to see a fix on this board. I'll try it soon.

Being new to all this, I haven't really found a good description of what it means to listen to "utilities". I thought at first it was police, etc, but these are usually on scanner bands, higher than those of the R75. So what is this? Where do I look!?

Please answer my stupid question. It is not a joke :-).

Hello Leigh,

I hate to say it but ICOM has been known to do things
such as this recently. They also make an R-3 hand-held
receiver that looks like a small Casio TV which was recently
marketed heavily focusing on the receiver being able to pick
up cameras in race cars(Nascar.) It is a first generation
receiver of this kind.
From what I have read and speaking with the ICOM Rep. at
a local Hamfest he stated that it works for regular TV reception
but does'nt work as advertised for the incar cameras. It does
pick up the Amateur SSTV as well. Some are happy with it.
Some are not.

Another example is the ICOM 706.
The ICOM 706 was introduced and refined twice in the last
5 years. Each time improving and fixing earlier things that
were complained about in the introductory model.
The third generation 706 is now referred to as the 706 MKII G.

I was on the leading edge by buying early but now the im-
proved radio can be purchased for $200 less with many better
and improved features. The trade in value on that particular radio
of mine has dropped 60% of the original purchase price in
5 years. This really reminds me of the computers that are
known to depreciate rapidly and you end up just about giving
them away.

You must credit ICOM that they do have a tendency to react and
correct problems that are apparent in the earlier version radios.

I suspect they will correct the problem with the R-75 but for
now it ICOM isn't going to acknowledge or advertise it.

By the way since we last talked I have ordered an R-75 too.
ICOM has a real good promotion going on currently.
Now just waiting for the brown truck to arrive.

Happy Thanksgiving ,
Eddie Bryant

From: yuf@phoenixdsl.com
Topic: 77 Message: 77

Okay, I've finally got a grasp of what utilities are, and now fear that I will someday own a decoder as well.

In the mean time, I'm just having a hoot surfing the bands and trying to pull in everything I come across.

I do not live in a particularly condusive environment. I live in a poured concrete building (with rebar), on the 4th floor, and have a north facing window. I'm in the Pacific Northwest of N. America.

Currently just using a active Sony AN-LP1, which actually seems to do a fair job. Was able to recieve the BBC from S. Africa, and the armed forces radio from Thailand. Many signals from Pacific rim, and S. America.

Anyway, the new topic: How about everyone giving their favorite methods for using the R75 to pull in weak signals??? So far I've had some good luck adjusting the RF gain to reduce static. Also, different stations behave better with AGC, NB, and one or none of the preamps. I never use S-AM, at least until I make the mod.

Anyone else with good methods for getting weak signals on the R75?

Any recommendations for my location situation with regards to a better antenna? I've tried some small loops, a horizontal wire, but none of them seems to do as well as the AN-LP1.

"Utilities" are those broadcasts and signals found on HF that are not international broadcasts or amateur radio (some may say that ham radio is a ute). Mostly military, aeronautical, ships at sea, RTTY, morse code, other data modes, etc are the so called "utilities". If you can get ahold of a copy of Monitoring Times, look for their utilities column, this covers them all in the form of readers' reports. There are some assigned HF freqs to US law enforcement, but these don't have the heavy usage of their VHF/UHF frequencies. Remote rural areas like Alaska have special emergency frequencies available for general emergency usage.

I use an MFJ 1024 active antenna with my R74, it is a good match, overall. I find that I usually don't need the preamps in the receiver turned on, and sometimes turn down the signal level from the MFJ. I use enough gain to get clear reception, with minimal noise and interference.

My best DX haul on the R75 was a Saudi Arabiam MW AM station on 1521 KHz, I was able to null out the US station on 1520 by careful use of the twin PBT and using USB mode, in the "ECSS" mode. If the ync AM was better (I haven't yet done the mod) it would be a superb receiver, even as original, it is a lot of receiver for the dollar. Mine gets 3-4 hours use average daily, more on weekends. I found the 30-50 MHz isn't quite as hot as in a decent scanner, but it is still pretty good. The 6 meter ham band has full specified sensitivity as does HF. The UT106 does a fair job of removing heterodynes, but really bad QRM or QRN still gets through.

If Icom would nake an R7000 (25-2000 MHz) receiver in the same package, it would be a real winner. My vintage R7000 is still good, but it has needed a bit of TLC and minor repair work, done by myself, to keep it running.

ECSS (I think it is "exhalted carrier single sideband") is using SSB mode, zero-beat on an AM signal. If the receiver and signal are stavle, it works quite well, and is useful in getting rid of nearby signal interference, one one side or other of the desired signal. I'm not 100% sure if ECSS is the correct term, but this method works nicely on AM MW and SW signals. Overall results depend on the receivers IF filter bandwidth and product detector stability. This doesn't work as well on older or less expensive "BFO" equipped receivers.

Ny R75 works very well using SSB on an AM signal, everything is centered nicely, so that switching between USB and LSB doesn't change the sound quality of the received signal. The narrower IF bandwidth does cut off the higher audio frequencies, and it gives human voice a little more intelligibility at the expense of audio fidelity.

Well, after my first day of using the R-75, I am really impressed! I have been comparing it to my Grundig Sat-800, and really can't tell much of a difference. The only edge that the Grundig has is the bass and treble features. I do not have the DSP module installed yet (have to send for it), and am really pleased with the R-75! I am using an Icom SP-21 external speaker on it and for antenna am using a 102' dipole. With the current deal on them, it is making them real attractive! Will probably be ordering the software for it tomorrow or Monday. Now to find a home for my Sat-800!

Larry,

I'm also a new R-75 user and think it's great after 15 years on a Kenwood R-2000. I don't know what software you're planning to get, but I'm also using Mark Fine's program for the R-75. My personal view is that it's quite good & the price is reasonable -- $60, but you can use the shareware version, with some limitations, free. I've heard the ICOM software is marginal. If you aren't overwhelmed with Mark Fine's product (http://www.fineware-swl.com/index.html), you might try the scancat folks at http://www.scancat.com/. If they don't have software yet, they should soon. Probably most important is to look around a bit and don't "default" to ICOM's software. I'm pretty sure you can to better. And yes, all you need is a standard DB-9 serial port cable for the connection, no special pins and connections to make.

Happy listening.

Ed P.

Right! I've been using that method frequently for AM signals on my R75.
It also significantly removes the distortion caused by fading. I used to
do that on my Sony ICF-2010 by using its synchronous detector, but I find
the SSB approach on the ICOM R75 works far better, and if I happen to tune
to another station I don't have to put up with the annoying clicks and
growls the Sony emits when I lose lock.

With SSB I sometimes use a rather wide filter setting to improve the audio
a little, especially if there's music involved: 2.4 kHz for the 455 kHz IF
and 15 kHz for the 9 mHz IF.

As for everything being centered, all sideband signals on my Sony are about
.2 kHz off frequency. After zero-beating some AM stations, I found that
ALL signals were off. The ICOM, on the other hand, is dead on!

Gerry

Unfortunately my computer wreaks havoc with shortwave radio reception, even though the antenna is outside and the lead-in is shielded, so I usually shut down the computer when listening and don't use any control software with the R75 at all.

An exception is when I use software for reading radio teletype or CW. It's great; all you do is patch the R75's audio into your sound card from the receiver's tape recorder output jack and the software takes care of almost everything else.

I must add here that RTTY reception works better for me if I use LSB instead of the R75's RTTY mode.

87. Rado mod report!

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-25 01:36:48 UTC
From: yuf@phoenixdsl.com
Topic: 87 Message: 87

Okay, so I'm a software guy that decided to hack a radio.

Doesn't sound good does it. I echo Rado's warning about begin
confident in your soldering. This is intricate work. It's easy to
screw something up with a errant piece of solder.

I'm happy to say that I don't seem to have ruined the radio.
I did both mods from Rado's pdf.

I am rather pleased, though, I had the idea this mod would work
differently than it does. I thought that I'd tune in an station,
and with S-AM it would just whistle a bit and then lock in. This
isn't exactly the behaviour in my case. Once close to a station,
I can swtich to S-AM. Whistle central. A few seconds does not
lock in, but some fine tuning of the frequency and/or the pbt,
and I can often get a really nice lock that sounds much fuller
than without. Usually one direction or another changes the whistle
frequency up or down. I go down until it goes away, afterwhich
I get usually get a pretty decent lock.

Is this the behaviour I should expect Rado? While I was at first
dismayed, the more I played with it, the more I seem to be able to
get very listenable setups for previously unlistenable AM signals.

At the very least, I have a S-AM mode that does something useful and
different now!

Please tell me I did it right :-)

Topic: 87 Message: 88

Dear Yuf,

With mod Ver. 1.1 I don't recommend tuning around in S-AM mode. Tune in AM mode and when you are at station switch to S-AM. With the 6 kHz filter when there is a strong station on either side of the one you are interested in sometimes the synch won't lock. This is because its trying to lock on the carrier of the adjacent station. In such cases I first use a narrow filter (2.4 kHz) which makes for easy lock of the S-AM. Then I switch to 6 kHz. If the interfering station is very strong then some PBT can also help.

If the lock speed seems too slow to you then increase the value of the resistor from Pin 3 to about 20 kOhms. This will make it much faster. Another option is to disconnect the resistor (i.e. downgrade to mod Ver. 1.0). If you decide to do this don't disconnect the wire from Pin 3 - you've already done a difficult job soldering it ... and you may decide to go to Ver. 1.1 again. Just wrap the end of the wire with insulating tape and secure it.

I've developed the mod according to my tastes - the stability is in first place for me (I use the S-AM when listening to a station ... so once locked I want to have it as stable as possible). I'm not bothered by longer whistles while locking. With Ver. 1.0 the synch is sometimes loosing lock in the deep fades.

Finally check again that everything is OK with the soldering.

Write back with your findings.

Best regards,

Rado

Hello Rado,

I have done version 1.0 modification to my R75 and find
it has really improved the AM reception quality.

I noticed you now have a ver 1.1 Mod. that involves an
additional resistor. Could you explain briefly what the main
benefit of this is?
I will most likely go back in mine and perform it.
I will also have to go back in again later and install the
DSP when it arrives.
I did notice on deep fades there is a tendency for a short
tone to appear briefly then disappear.
I assume the resistor attempts to limit or eliminate this.

Thank You for your effort on this fix and I know
it is a time consuming affair for you.
You are doing a great job especially the detailed mod.
instructions.

One thing on Ver 1.0 :

I would suggest adding a 1 megohm resistor
in series for safety purposes on your instructions for the
makeshift static strap in case it comes in contact with a high
voltage source it would provide a degree of safety and not
endanger the safety of the person working on the mod.
All commercial static straps have this incorporated into
them. Maybe grounding the chasis of the radio and ground-
ing the soldering iron would be a better idea. If the person
doing the mod. rests his arms against the chassis of the
radio prior to soldering he will be effectively grounding
himself through it as he does the soldering.

Just sounds a little safer.

I am really enjoying the R75 !

Keep up the fine work ! ,
Eddie Bryant

faster.

Hmmm.. the pdf version doesn't deal with pin 3 at all, so I didn't
do this. I simply did the two caps to pins 23 and 4.

The radio behaved strangely for a while I've decided, and that there
must have been a small short to the board where pin 23 had been pried
up. So, essentially, it was hooked up such that there was simply
a cap to ground from ping 23, but pin 23 still connected to the board.
Do you know how this configuration would behave? It may explain my
earlier issues. Essentially the lock was *molasses* slow. Creeping.

I believe this is now not the case, and the radio behaves much better.
It now locks in very quickly with little whistling (none at all if I'm
right on frequency). This seems much healthier.

I must say this -- the overall AM reception is noticably smoother
I believe. Even without sync, I believe the AGC mod does good things.

Hi Eddie,

> I noticed you now have a ver 1.1 Mod. that involves an
> additional resistor. Could you explain briefly what the main
> benefit of this is?

The resistor slows down the lock/de-lock speed of the PLL. This makes for a stabler synch. detector. The side effect is longer whistle (about 1-2 seconds) before the synch. is locked.

> I did notice on deep fades there is a tendency for a short
> tone to appear briefly then disappear.
> I assume the resistor attempts to limit or eliminate this.

Yes it makes the synch. "fly" over carrier fades. It will take 2 or more seconds of complete carrier absence before the PLL will start drifting ("losing" lock). Unfortunately there is no "LOCK" output on the IC (there is one on the older stereo AM IC - MC13020). If there was one it would have been possible to make the receiver switch the audio to synch. detector only after the PLL is locked (i.e. the way it is done in other receivers - like AR7030).
The best way of performing mod Ver. 1.1 is to find the resistor value according to your tastes. First connect 10 kOhms resistor in series with 10 kOhms or more pot. Turn on the radio (as it is open) and by adjusting the pot find the best compromise lock speed/stability. I expect different users will find different values to work best. Then disconnect the resistors set and measure the resistance - this will be the value of the resistor for Ver. 1.1.
Another idea I had was to use the "LOCK" button on the set to switch between fast synch. (mod Ver. 1.0) and slow synch. (mod Ver. 1.1). This way after tuning in a station one can push the "LOCK" button and switch to slow synch. The button will also lock the tuning knob so no way to de-tune and hear whistle. Unfortunately this is not very easy modification ... not to say impossible.

Maybe the best way is to add a stereo jack at the back panel and make a small remote switch - small box with a switch connected to about 50 cm of cable and ending in a male jack. The ring of the female jack is connected to 5 kOhms resistor from Pin 3 (REF 3.0V). The tip to another 5 kOhms resistor going to the positive leg of the cap. at Pin 23 (BLEND). The resistor is split in two in order to avoid damage if either the ring or the tip is connected accidentally to ground. The switch in the box should be connected between the tip and the ring of the male jack. Then the operation will be:
- switch open (fast synch.) ... tune in a station (when the synch. is in fast mode there will be almost no whistles)
- after the synch is locked close the switch - synch. in slow mode

- listen to the station

Maybe I'll add such switch ... maybe not. I'm quite happy with the current performance.

> Thank You for your effort on this fix and I know

Thanks for the suggestion. I'll add it to the mod instructions. To be honest - I've never used static strap ... just the receiver chassis.

Best regards,

Rado

I'm happy you found the problem.

> I must say this -- the overall AM reception is noticably smoother
> I believe. Even without sync, I believe the AGC mod does good things.

Yes it improves the AM reception also. This was the first mod I've done.
Then I went to Pin 23 for the synch. mod. And finally to Pin 3 for the
stabler synch.

Happy listening!

Rado

Hello all,

I just accomplished the Ver 1.0 Rado modification today to my R75.
I did some more listening tonight and I can say this receiver is really
amazing with the Rado Mod Ver 1.0
I was doing a side by side comparison with the R75 and my ICOM R8500
that has no synchronous detection.
I had to search to find a rapidly wavering signal to really test it.
When I did , I could not believe the difference. The R75 really had a
crisp clear signal that was there all the time with the AM sync. turned
on. The R8500 had the raspy sound around the edges when the signal
dipped. When you hear it side by side you really appreciate the difference.
This is what is annoying about listening to shortwave without the
synchronous detection. You will miss whole sylables to the words and
the brain has to work overtime to reassemble the missing sounds.
This is no longer a problem here with the modified R75 !
The earlier tones I heard that were mentioned in my previous post are
not present now. I believe it was operator error and I was slightly mis-
tuned on frequency.
Even with the AM sync. turned off this receiver is superb. I think even
the first part of Mod. Ver 1.0 is a drastic improvement.
I must admit I am so impressed with this reciever I would almost like to
buy another one to replace my older SONY 2010.
I must say with the Rado Modification makes the R75 a true contender
to the SONY 2010. On comparing the SSB to the SONY 2010 the R75
puts the SONY to shame. This is now one nice radio.

Thanks again to Rado for his research and help....

Eddie Bryant

>This is no longer a problem here with the modified R75 !

It must be nice! I'd like to thank Rado, too, but in my case, I'm too much of a klutz with a soldering iron to risk damaging my nice, new receiver by carrying out the mod. As I mentioned earlier, when I use USB or LSB on an AM signal, the distortion due to fading disappears, anyway, and I hardly miss anything, unless the fade is so deep that the signal disappears altogether.

>On comparing the SSB to the SONY 2010 the R75 puts the SONY to shame.

I know what you mean; got my R75 only a few weeks ago, and put my Sony ICF-2010 out of use altogether.

The R75's accuracy and stability is truly impressive on sideband, and the twin PBT solves lots of interference problems, especially on the crowded ham bands during a contest. The main reason I bought the R75 was the fact that 90% of my listening involves sideband, and my 2010 displayed all the frequencies inaccurately. For example, I had to tune to 11282.2 USB to clear up the audio, when the true frequency was 11282.0 (flights working San Francisco). I wound up storing all my SSB frequencies in memory using the .2 kHz offset.

The offset was actually only .1 kHz when the set was first turned on, then it stabilized at .2 kHz after about an hour of use. At any rate, the 2010 wasn't stable enough to use the method mentioned above for listening to an AM station in SSB mode, but the sync detector was OK (in my opinion, the 2010's only asset).

When I also take into account my 2010's reduced sensitivity due to a blown FET in the front end (mine is an early 2010) plus the irritating buzzes and birdies caused by the radio's internal CPU, the R75 is like a breath of fresh air.

From : Eddie Bryant
That is exactly what I used to do on my Kenwood TS-440 Transceiver and it worked great. Then I got the SONY and really learned to appreciate the Sync. Detection.

>The main reason I bought the R75 was the fact that 90% of my
>listening involves sideband, and my 2010 displayed all the

On doing a side by side comparison to my older SONY 2010 I found it was innacurate too, by 100 hertz or so. Enough to make the sideband sound unnnatural. I suppose there may be a way to calibrate that, but still your limited to tuning whole 100 hertz steps. I never realized this until I had the R75 next to the 2010 and was doing comparison listening.

>AM station in SSB mode, but the sync detector was OK (in my
>opinion, the 2010's only asset).

I must agree completely. And the radio has lasted for quite a few years as a superior radio. The 2010 is more portable (somewhat) than the R75 for people that need a smaller radio to travel with.

>When I also take into account my 2010's reduced sensitivity due to
>a blown FET in the front end (mine is an early 2010) plus the

I suppose all radios have their birdies. This raised my curiousity. I connected a 50 Ohm Dummy Load to the antenna connector and proceded to scan the radio through the frequency range it covers. Surprisingly the R75 generates few birdies internally. The Preamp really reduced these when they were present and I don't think any of these will present a problem listening. None of the birdies that were found even to move S-meter. At one point I found a signal with audio on it. This was WWCR on 13845 getting into the radio with the dummy load connected. It was not moving the S-meter at all though. Of course it was coming in with a booming S9 +20db signal when I connected the 2 foot telescopic whip. A local broadcast station ,WBT at 1110 KHz, was giving the same reading on my S-meter.

This is one very good receiver. I must admit ICOM went to the extra extent to minmize the internal signal leakage. Even the ribbon cables are shielded and the front panel has a solid metal backing in the R75. There are some pictures in the files section that show the internal workings of the R75.

There is some great quality construction here by ICOM.

I noted the birdie frequencies if anyone wants to compare or are just plain interested I would be willing to send a list of these to you.

Hello Tony,

Let me also say that some of these were barely perceptable. I had to switch to SSB to even hear some of these. As I said before, none of these even move the S-meter. They are really down in the noise floor. With the antenna connected these will probably be hard to hear if at all.

I did have my computer turned off for this test and the ANT 1 was terminated into a 50 Ohm non-inductive resistive load

I did not get a chance to check my SONY 2010. I believe the internal antenna is always connected on it. I might get around to that later

Here are the "Birdie Frequencies"

58.981 29.490
56.525 27.033
55.677 25.495
54.066 24.575
51.610 23.004
49.237 20.540
49.150 19.660
46.693 17.203
44.236 14.745
41.980 11.975
39.921 9.830
36.863 9.462
34.406 4.517
33.993 0.455
30.000

Happy listening!

I'm currently experiencing a problem whereby very strong signals are double-spotting exactly 5 kHz away on some frequency ranges.

Has anyone else experienced this phenomena or have any idea what the cause may be?. Only started happening a few weeks back, and occurs regardless of whether the preamps are switched in or out. There are no other obvious manifestations or general overloading problems apparent.

I'm using an unmodified R75, with DSP and FL223 SSB filter added.

Thanks!

101. UpGrade for M-7000 VS. 5.04, for use with ICOM R-75

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-26 13:48:59 UTC
From: Ed Pusey
Topic: 101 Message: 101

Friends,
I am the owner of M-7000 VS. 5.04, SN# 11202. A series of questions I hope you could answer for me:
1. Availability of upgrade (hardware or software) and price to a □newer□ version from M-7000 VS. 5.04.
2. If □yes□ to #1, what benefits accrue from the upgrade?
3. Your recommendation, if any, on the optimum TNC software program to control the M-7000.
4. Any trade-in options from M-7000 to M-8000?
5. Does any combination of hardware/software you use/provide allow for □auto decoding□ of signals? I confess I□m a bit lazy, but more importantly, after several years of using the M-7000, if find (or presume) that since many of the signals I receive seem □undecodable□ (at least by me), that they are encrypted. Main challenge is that I□m never certain if I□m using the correct mode. For example, I□ve come across many signals that must be (I presume) at 72 baud that must be ARQ-E or ARQ-E3, or others at 96 baud that must be either of those two or ARQ M2/M4 (TDM Moore), but no amount of effort results in a decipherable output. I□m using a new ICOM R-75, which is light years ahead of my old Kenwood R-2000.
6. I□ve investigated sinking big bucks into a HOKA Gold Pro software package, but note they have very mixed reviews. Similarly I□ve looked at ads for the wildly expensive WAVECOM computer plug-in boards, but the latter is clearly out of my reach, so I□m looking for advice.
Appreciate your time and assistance. Hope to hear from you soon.
Sincerely,
Ed Pusey

102. Re: Birdie Frequency List

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-26 14:48:10 UTC
From: Gert Nilsson
Topic: 87 Message: 102

I checked the birdies (internally generated signals) in my R75.
Operating conditions were USB, normal selectivity and PBT centered. 3
kinds of birdies was discovered:

Associated with the BFO frequency:

453.5 and harmonics 907.0 , 1350.5 and 1814 kHz

Associated with the mixing from 9010 to 455 kHz IF moving when the
PBT is used:
9465 (= 455+9010)
1871
5885
9882
16980
23004
25494
27983

Unknown origin
19660
19991
22579
29491

Very strong signals on the high frequency shortwave bands did leak
into the receiver despite a shorted antenna input.

When receiving I have found some strange signals in the 25 meter band
associated with the PBT, just audible on very weak signals as a
whistling sound changing with PBT settings.

The preamplifier 2 is too sensitive for operation on the AM band and
produces a lot of second and 3rd order intermodulation.

The preamplifier 1 is quite good. Not very much intermodulation above
1 MHz, probably due to the input passband filters, which are used
above 1,6 MHz.

However if you are interested in utility below 400 kHz here in Europe
you may have intermodulation from very strong longwave stations. 171
+ 189 kHz produce a signal on 360 kHz. This is a problem only if you
have very long antennas say beverages of 700 meters offering
impressive signals on longwave! The problem is the preamplifier, not
the first mixer. I can use a homebuilt broadband preamplifier with a
2N5109 transistor replacing the PRE1 without any intermoduulation.

>the R75 for people that need a smaller radio to travel with.

Right now my 2010 can't be used very effectively as a portable. The blown FET has seen to that, because the reduced sensitivity makes performance poor with the telescopic whip. Also, there's the well-known problem of memories and clock being totally reset if the computer batteries work loose, as they often do when the set is bounced around a bit. In all the time I've had the thing I've used it as a table radio, so the R75 is now the only receiver I'm using.

And yes, bravo to ICOM for the R75's internal shielding (I've seen those internal photos)! The metal cabinet seems quite rugged, too. If I had my way, ALL digital equipment would be properly shielded, including computers, fax machines, music keyboards, etc., all of which generate wide-band RFI. Had to move my listening post out of my home office into a separate room in order to escape the RFI from the computer and fax machine; the fax machine's clock circuit and the computer's power supply are still putting out even when the devices are not actually running. I can usually get around interference from TV screens by using the R75's twin PBT on my target station, but that doesn't help me one bit with the digital stuff.

Topic: 104 Message: 104

1000 thank you's to Rado for posting the
AGC and Sync modification for the R-75.

I can definately hear smoother sound on the
AM band, what a welcome relief. I also hear
the momentary tone when I engage the S-AM,
as reported by others. I did not add the 20K
resistor, as I don't really listen to AM for
sound, I listen for DX, so that mod doesn't
seem to be that important to me...but maybe
I am missing the point of the S-AM (since it
never worked before).

My question would be, what does the S-AM really
do for you ??? The AGC mod is obvious to my ears.
Does the S-AM simply reduce the effects of skywave
fading, or does it actually give you better
audio response ???

My last HF radio was a RS DX150A, and it has not
been turned on in years, and years, and years.
I bought the R-75 in January and have been rather
pleased, except for rather harsh sounding audio.
I have yet to find an external speaker that makes
me happy either.

Last...DO NOT even think of doing either mod unless
you have EXTREMELY good soldering skills. I know it's
been said before, but it is worth saying again. I've
been a darn good solderer for over 15 years and I
had a few 4-letter moments with this one !

> audio response ???

Hello Bill,

I have found the Synchronous detection reduces the
distortion that is caused by fading. This is when your
S-meter takes a dip and things start to sound harsh or
unintelligible. Sometimes you will even lose the signal
all together. I must admit the first part of Rados mod.
does make it hard to hear the difference between having
the AM Synchronous on and having it off on the R75.
It is almost too perfect ! If you have another shortwave
tune it to the same frequency and listen to the difference
on a wavering or fading signal that the R75 makes.

There is a lot of technical explanation behind this but
basically the above is what it eliminates.

There was an article in last months Monitoring Times
that discussed the AM Synchronous detection in
more technical detail.

107. Filter Set Mode

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-28 01:18:41 UTC
From: jrev@ev1.net
Topic: 107 Message: 107

Has anyone found a sort-of "Factory default" set of settings for the filter selections? (Are would that be the 'oP 1 No' selection each time?) Really what I'm asking is has anyone found a sort of "sweet spot" of settings for all round general use.

I do a little of everything....AM, SSB, CW, Digital decoding. I find myself constantly fiddling with the filter set modes... which is fun and brings about lots of different results when copying and decoding digital signals. But is there one set of settings that is best for all round general use?

Is there a way to "reset to default" quickly?

108. MOD WARNING !!!

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-28 02:13:30 UTC
From: Radostin Danev
Topic: 108 Message: 108

The mod appears to be quite difficult. Here's a STRONG recommendation to the people who think of performing the mod to their R75s:

This recommendation will be included in the mod Ver. 1.1 instructions which I'll upload this week. (no more delays)

STRONGLY RECOMMENDED!

Take a junk surface-mount PCB (from VCR, TV etc.). Imagine this is your R75's main board.
Try performing the mod on some of the surface-mount ICs. See how's your success rate.
Then decide if you are capable of performing the mod on the real thing.

After finishing the Ver. 1.1 I'll try convincing iCOM or some other company to offer it as a fix. So everybody could have their R75s fixed.

Best regards,

Rado

109. SV: [icomr75] MOD WARNING !!!

Agree. I did that.
I took a PCB from an scraped cordless phone (the base-station) which contained some SMD-IC's. The pin-density was in fact even higher on these chips. Excersised on lifting pins: Heat and bend, heat and bend, heat and bend... ;-)

Mod works great. Thanks!

Thank you Scott! but ICOM is still being evasive as regards FAQS and mention of the R75!!!!!!!!! Ibelieve
they are actually pretending SYNCH AM DETECTION problem does not exist ! Okay there is a problem!!!!!! we all know about it !and it needs a fix at ICOMS exspense at the dealer where you bought it from where ever you live in the world .Its great that some people have the technical know how to fix the problem! Whats bugging me is that we have all been ripped off whether you agree or not ! we have bought a "pig in a poke " whether you admit to it or not !its as plain and simple as that!

As for myself I use AM SYNCH on SSB at times also AM and fiddle with the dial no Problem and Ime Happy ! you see I listen to shortwave USB ,LSB AND AM, UTILITIES and Ime having no problems with my handling of the Radio! perhaps that explains why ICOM has not responded to all this Synch detection ? if there is something wrong with the Synch am detection why have they not put in a call
for a fix!!!!!!!!!! and I am not prepared to so call modify it myself ?
Just my few cents worth !!!!
Tony,

112. R75 CW/SSB filter advice

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-28 14:33:18 UTC
From: Michael Oexner
Topic: 112 Message: 112

Hi all,

having operated an ICOM R71A very successfully for over a decade, I'm now very close to buying an ICOM R75 plus UT-106 DSP-unit. My R71A is equipped with the additional FL-44A SSB filter and the FL-63 250 Hz CW filter.

Last week I was on a business trip to Berlin and could test a "naked" R75 at an amateur radio dealer. Now I *know* that I want to have one!

My main DX interests are utility stations in general, and especially NDBs in the longwave band. For this reason I want an additional 250 Hz CW filter plus a 1.8 kHz SSB filter (basically the same setup as with my R71A).

The R75 would allow the following combinations:

A)
FL-53A 250 Hz CW filter in the 455 kHz IF
and
FL-223 1.9 kHz SSB filter in the 9 MHz IF

or

B)
FL-101 250 Hz CW filter in the 9 MHz IF
and
FL-222 1.8 kHz CW filter in the 455 kHz IF.

Neglecting any prices differences, what combination (A or B?) would make more sense from a technical point of view? My educated guess runs into the direction of combination A. In which way are the filters cascaded, i. e. would one of the above combinations be ruled out from that perspective?

Your expert input would be very much appreciated :-)

vy 73 + gd DX,

Michael

The design flaw is well known, actually. Before I bought the radio I had done my homework, and so I already knew that the "S-AM" mode was inoperative, because this was mentioned in a review in the 2000 edition of WRTH. Since synch detection wasn't important to me, it didn't stop me from buying the R75, especially because my second choice would have been a Drake R8B, and there were a few things about the Drake I didn't care for.

I'm certainly not trying to legitimize ICOM's error, but nearly every electronic device I've purchased over the past 10-15 years has had one or more flaws; my Sony ICF-2010 is one instance I've already mentioned, but then there's the shoddy Compaq computer I'm writing this e-mail on (repaired during the warranty period, but the hardware problems came back to haunt me once the warranty ran out), my pocket organizer, which stopped working altogether after the warranty ran out, a Ricoh camera that developed a fatal flaw in its electronics, again after the warranty ran out, etc. etc.

Oh, and by the way: More than a decade ago I bought a Radio Shack DX-302 receiver; besides its poor performance, it also developed a flaw in the LED frequency display, so that some of the segments wouldn't light up.

Again, ICOM needs to address the synch detection issue, but it looks like things just get put on the market too quickly these days, before the bugs have been ironed out. Not to mention software!!

Gerry

O K Gerry...everything will be fine now.. thats why we are here for each other...at least Rado has fixed this up for us... five dollars worth of parts and solder, to make our radios perform like an HF1000!!
We should consider ourselves lucky to have him ...Thanks Rado!!
I personally cannot afford to buy an R75, but find this is a fantastic list.
I will read it till my boat comes in.
Anyone wanna buy a Pinto with newer Firestone tires?

There is one more thing to consider. If everything was OK with the R75 then it would not sell for $500. I personally prefer to buy it cheap and to modify it. So the iCOM flaw is beneficial in some way.

Best regards,

Rado

116. Re: [icomr75] ICOM Reputation

From: Eddie Bryant
Topic: 116 Message: 116

I considered the Drake R8B before taking the leap and
getting my R75. The R8 has gone through it's steps for
improvement too and I have even heard of mods. for the
R8B have to configure a shield of some sort to isolate the
interference from the noisy LCD display.I just could not
pocket the higher price of the R8B that tops $1000.00
(US) New.
I like the idea of the quality construction that ICOM is so
well known for. Like Rado said, a radio of this quality
especially with the current specials underway would be hard
to beat. I think the radio should be priced in a much higher
price range.
I have several other ICOMs and have owned KENWOODs
as well. ICOM does seem to be the leader now in many areas.
I also like the options that are available for the R75 and even
though this radio has the minor problem with the AM Sync.
it really shines in all the other areas.

Even if you took your ICOM to a local radio shop and had the
mod. performed by a technician you would still come out
cheaper than buying a Drake R8B.

I have even considered offering to modify R75's for people
that are in the situation of not having the technical know-
how or knowledge to do it. It is really a straight forward mod.
for an experienced technician with the right equipment. I
have just been waiting to hear ICOM's response if there is
one. They have already said it is OK to mod. the radio as long
as proper techniques and practices are observed and the radio
is not damaged in the process. Hopefully we will hear from
ICOM on this situation if enough people voice their opinions
on it.

Eddie Bryant

> turned you away?

Well, I'm aware of Drake's long-standing reputation, of course, but I prefer a good, smooth, weighted tuning dial like the R75 has, since I rely heavily on the VFO; I rarely use the scanning features, in fact. The Drake R8B's dial wasn't quite what I was looking for. Also, when I saw that the R75's VFO could tune in 1 hz steps, I was sold on it, esp. after having been limited to .1 kHz steps by the Sony 2010.

I also preferred the R75's extended coverage: Up to 60 mHz.

Drake's display is not as easy for me to read as that of the ICOM, and I don't like the layout of the R8B's controls, either.

These are all subjective reasons, of course. I'm sure the Drake R8B is a fine radio overall.

Naturally the ICOM was less expensive, that didn't even come into consideration.

Regards,
Gerry

118. AM -SYNCH

Hello All,
at the moment I have 1560 NY DISNEY on the R-75 using S-AM,
using the wide filter and it has not been modified !and its a clear
S9 considering New York City is about 500 miles from Southern Ontario
Canada could not ask for anything better ! the time here is 8pm EST
and the news is on! could not ask for anything better !!!!with due
respect to Rado ,I really cannot justify modifying this Radio! unless
somebody can explain to me why it would be a asset and not just a
figment of imagination that it would sound better , I admit I dont
use AM to much mostly listen to shortwave, SSB, Utilities, this 1560
NEW YORK STATION on AM S-SYNCH right now is perfect and if it wasnt
all I would do would switch to SSB and its still Perfect ??? I am
telling you this as I actually bought the 100uf capacitor today,to
do the mod ! Ime sorry but Ime telling it as it is !!!!

Regards
Tony Berry.

119. Hi list

Hi list !
Yesterday I received the r75, recently I bought the rx via Universal Radio.
I am a listener and dxer for but of 20 years and electronic technician.
After a lot to think and to investigate opted for him because it have with
A-NOTCH, DSP, PBT, syncronous detector (I will make the mod of Rado !!),
and according to the tests that I read it is a very good receiver, keeping
in mind their price.
I believe that it should have better rx as the nrd545, but their cost is
much bigger.
I also possess a tabletop Yaesu FRG-8800, Sangean ATS 909 and a wideband
scanner Yupiteru MVT-7100.
My FRG-8800 is a very good receiver, but I was surprised filters of the R75!
To rabid noise in 4875 khz you converted in to radio station of Bolivia in
the R75, with the filter in WIDE mode!
Could some of you tell me according to their experiences which the best
combination of filters is to select to make according to the sign type to
listen? for example AM, SSB for decoding, etc...
I am in many lists but this it is fantastic!
Sorry for my english
Cordial greetings,
73?s
Enrique

You're lucky I guess. My am-s makes things worse. Can't use it at all most of the time. However, once in a bluemoon it works like magic! Don't know why. But 97 percent of the time it doesn't work. I have made comparisons with my R5000, NRD525, and r71a. None of these have sync. yet sound better with less fading on AM than the R-75 with the AM-S on! I like the radio....but the AM-S simply doesn't work on mine, and in fact, as Passport pointed out, makes things worse so that it is useless.

Hi Enrique,

I have asked the same question about the filters....but so far no one has had an answer.

If I set it up for decoding digital then I am not altogether happy when I listen to Broadcast and vice versa. I think there is a magic combination out there somewhere that I could live with if I can just find it! Guess I am just lazy and hoped someone else had already discovered it ;-). Then again 'diddling' with the filters is sort of fun!

122. R75 Filter Questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-30 04:01:14 UTC
From: khgrant@ix.netcom.com
Topic: 122 Message: 122

I've been a bit of a lurker here for a while. Its encouraging to see the number of messages increasing in this group.

I'm somewhat confused about how the 9Mhz and 455kHz filters in the R75 are used. The manual is not helpful at all. Are the two sets of filters always used in series with one another? i.e is there always a 9Mhz filter (of some bw) in one IF as well as a 455kHz filter in the next IF? How does one choose which BW filter to use in each position for a particular listening situation?

For example, I listen to UTEs a lot and choose the 2.4 kHz filter for this. I also use SSB for AM (I havn't done the mod yet). For AM work I would like a wider BW; do I only get a new 455 filter? Or would I be better off with a new 9Mhz filter as well?

I'm also confused about the filter setup menu. Here the manual really sucks. Anyone have a good explanation about how to use this?

I've heard someone (perhaps on StrongSignals.net) has a paper for sale that explains some of this, but I'm hoping someone can help provide information that Icom left out.

thx

Keith

I agree.
The manual doesn't help a lot.

124. More ? Re: Filter Selection - Anybody Knowledgeable?

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-11-30 06:38:02 UTC
From: jjga@usa.net
Topic: 124 Message: 124

I also wonder which filters to buy/install/use depending on your listening preferences and/or priorities.

I don't have the R75 yet but want to know before-hand which filters will work better, regardless of price.

If you want to fill both filter positions (9 & .455) which ones you should get by intermediate frequency if priority is:

1. world radio broadcasts ONLY
2. world radio broadcasts AND utilities (SSB voice transmissions)
3. utilities AND digital modes (RTTY/CW)
4. world radio, general SSB, RTTY/CW, a little bit of all three

Can anybody write the manual on it?! Please be clear and specific about which filter to use and where to install it.

Several 'filter-related-replies' so far in the group, but none really 'comprehensible', 'convincing' yet, IMMO.

It would help many people, it would be a 'doc' that should be placed in the 'files' section of the eGroup, I feel.

Anybody?!

Thanks,

J a s o n

In the R75 you always have a 15 kHz 9MHz filter ahead of the noise blanker and the other filters. In AM wide the 9Mz filter is bypassed but in other settings you have a good 9Mz filter followed by a good 455 kHz filter making the selectivity excellent.
Settting the selectivity:
If you press the filter button for 2 seconds you get into the filter selection mode. Pressing the up or down button selects the narrow, normal or wide position for the different IFs. Rotating the tuning knob choose among the filters. I have the 2,8 kHz filter for 9MHz and 3,3 kHz for 455 kHz IF. I have the following setting for SSB:
Narrow: 2,4 + 2,4 (2,15 kHz total)
Normal 2,8 + 3,3
Wide 15 + 3,3

Sometimes I use 2,4 +3,3 in the narrow mode with a total bandwidth of 2,45 kHz

Subject: [icomr75] R75 Filter Questions

I've been a bit of a lurker here for a while. Its encouraging to see
the number of messages increasing in this group.

I'm somewhat confused about how the 9Mhz and 455kHz filters in the R75
are used. The manual is not helpful at all. Are the two sets of
filters always used in series with one another? i.e is there always a
9Mhz filter (of some bw) in one IF as well as a 455kHz filter in the
next IF? How does one choose which BW filter to use in each position
for a particular listening situation?

For example, I listen to UTEs a lot and choose the 2.4 kHz filter for
this. I also use SSB for AM (I havn't done the mod yet). For AM work I
would like a wider BW; do I only get a new 455 filter? Or would I be
better off with a new 9Mhz filter as well?

I'm also confused about the filter setup menu. Here the manual really
sucks. Anyone have a good explanation about how to use this?

I've heard someone (perhaps on StrongSignals.net) has a paper for sale
that explains some of this, but I'm hoping someone can help provide
information that Icom left out.

From: Gert Nilsson
Topic: 124 Message: 126

My personal opinions:

1. world radio broadcasts ONLY

455 kHz filters can not be used in the AM-S mode but in AM mode. I would recommend the 3,3 kHz for 455 kHz and 2,8 kHz for 9MHz (Used in the narrow or medium positions)

2. world radio broadcasts AND utilities (SSB voice transmissions)

I think 2,8 + 3,3 kHz would be good but a 1,9 kHz and 2,8 kHz would be fine too.

3. utilities AND digital modes (RTTY/CW)
1,9 kHz in both IFs or 1,9 + 0,5 kHz

4. world radio, general SSB, RTTY/CW, a little bit of all three

No obvious choice, you can´t get it all If you choose 2,8 + 1,9 you miss the tight CW option but this would be my choice.

Gert:

Thanks for your reply! Your explanation helps me a lot.

One question though: If you have a 2.4kHz filter for 9MHz, what is the effect of having a wider (3.3kHz) filter for 455? Isn't the effective bandwitdh of the resulting signal still 2.4kHz? Or do the skirts of the 3.3kHz filter help out with selectivity in some way? Or does this somehow improve PBS?

Still learning,

Keith

I just discovered that yesterday, too. My R75 is unmodified, but when S-AM is on I can definitely make it lock and unlock by tuning across the frequency. In my case it doesn't help a lot, but it doesn't spoil anything, either. Seems to work best with a wide or normal filter, not with a narrow one.

What I forgot to do yesterday was turn off the feature that defaults to straight AM when the signal is too weak. A fading signal kept toggling the synch mode on and off, so if the R75's synch detector would have had any effect on distortion due to fading, I wouldn't have heard it anyway.

Still crazy about the ICOM R75, though!

Gerry

> Narrow: 2,4 + 2,4 (2,15 kHz total)
> Normal 2,8 + 3,3
> Wide 15 + 3,3

That helps quite a bit, Gert. As others have said, the manual isn't too clear on this; to make it a bit clearer: Filter combinations can be stored for each of the modes. While you are in the filter set menu, just activate the mode for which you want to set up some filters, e.g. SSB, CW, AM, by pressing the key for that mode. You'll see the corresponding indicator appear in the filter menu.

For each of those modes you can select the filter pair to use for "narrow" (shown in the menu by N), "wide" (W) or default (no letter will appear).

Once you have established your settings by pressing the filter button once more to exit the menu, you will find that the filter combinations are different for each mode in which you listen. This alleviates the necessity for finding one setting that will suit all the modes, as the receiver will remember your preferences. You can always override them on a case by case basis, too. As you may already have noticed, any frequency you write to memory will be stored with the filter combination in use at the time.

Hope I didn't confuse anyone still further. It basically takes a bit of experimentation and practice to compensate for the lack of more detailed instructions in the user manual.

Regards,
Gerry

The skirts will be much better with the 3,3 kHz filter! A 2,8 kHz would be perfect for this purpose.

Me too! Nearly. It won't be until I actually have the Rx and 'play with it' that I will definitely know if I did O.K. (or not) by getting the FL-257 (3.3/455) and the FL-223 (1.9/ 9). It looks that's what I 'need' to both improve ECSS reception of shortwave broadcasts (priority #1) and at the same time 'separate' rather well close-by 'hams' or other utilities in crowded SSB conditions (priority #2).

Or SHOULD I GET THE 2.8 (455) instead (of the 3.3)?! Hmmmmmmm!

Please Gert et al, let me know if I'm doing it wrong, I still can change my order w/ Universal Radio, they won't have the filters in stock until the end of the month! (I won't even get the rig 'til next week, and I am already suffering knowing I won't be able to do myself the 'famous' AGC/S-AM mod from Rado since I CAN'T SOLDER, geez!) Feel free to post or send me directly your welcomed comments.

By the way, any other place in the U.S. other than Universal where I can get the filters at a competitive price? AES? HRO had the 257 for ¡¡¡$199.00!!!, way too expensive.

Since I started this thread, a big THANKS to all the people that, one way or another, are helping the 'community' figuring out this filter-stuff by taking part in the discussion.

Just got mine out of the box. I have the FL257/3.3 kHz-(455 kHz) and the Fl103/2.8 kHz (9 mHz)
Works perfect for ECSS of broadcast stations. SAM isn't needed with this set up, which is good
because I am too chicken to do the mod.

Well, let me add my 2 cents worth in to further confuse the issue :).

I originally thought that the 3.3 KHz 455 KHz filter and the 1.9 KHz filter would be an excellent combination.... and it is, for AM... the 3.3 filter works very well for MW and strong broadcasters. However, I find myself using the R75 for utility listening most of the time, so I've changed my plan...

One of the things I found was that the filters do not work by themselves... there is a 9 MHz filter in line BEFORE the 455 filter. I knew that, but didn't think about it when I choose the filters...

So what? It seems to me, and this is PURELY personal, that the radio sounds much better if the 9MHz filter is wider than the 455... kind of like a funnel if you want to think of it that way. It works with the 455 wider, but it doesn't quite sound right to me... almost like the second filter doesn't really do anything (which it really doesn't do much).

With the 3.3 filter and a wider 9 MHZ filter (the built in 15), the audio on a clean signal was quite good... of course, you can use the built in 15 and built in 6 too, and get wider audio if the signal's that clean :)

So I've replaced the 3.3 with a 1.9 (FL222 is incorrectly specified as 1.8 in much of the early literature and catalogs, and even in the radio, but the filter and the package indicated 1.9) for SSB. I left the 1.9 in place at 9MHz, and this creates an excellent SSB Narrow mode. It also makes a not too bad AM Narrow mode, but it's a bit too narrow to listen to much in AM mode (I tend to use ECSS anyway for DX that's not good enough to run AM, rather than sync...No RADO mod here :)).

Also remember that EACH MODE has filter settings! There's a Narrow, Wide and "normal" mode for each mode. So for AM Wide, I have 15 and 15 (as I remember), for AM Narrow I have 2.4 and 1.9 (I think) and for AM normal 15 and 6. Narrow is really too narrow, and the 3.3 filter worked very well here for both narrow and normal, but my priority is SSB....

For SSB, I have 2.4, 2.4 for Normal, 1.9 and 1.9 for Narrow, and 15 and 2.4 for Wide. Wide works fairly well for ECSS and both Normal and Narrow work well for uitlity listening... I use normal most of the time (which really means I would not have had to add a filter at all!).

I hope this helps...

138. R75 mod Ver. 1.1 uploaded & a suggestion

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-01 06:32:32 UTC
From: Radostin Danev
Topic: 138 Message: 138

Hi group,

I've just uploaded mod Ver. 1.1 in the "R75 mods" folder together with some other files.

For those who cannot or don't have the courage to perform the mod here is a suggestion:

Contact "Kiwa Electronics" at:
http://www.kiwa.com/
Send them the modification instructions and ask if they can perform the mod for you. They offer many modifications for other receivers so I think they'll be happy to help. If there are enough requests they can implement the mod as standard offering and even improve it.
The information about the modification is ABSOLUTELY free. If they are worried about using it please tell them to contact me for assurance.
Ask them to perform the full mod Ver. 1.1. If you are not happy with the slow PLL part then it is very easy to cut and insulate the wire from pin 3.

If somebody knows of other company or person who can perform the mod - please share the information with the group.

Best regards,

Rado

139. Reply from KIWA

Topic: 139 Message: 139

Hello R75ers!
Below is a reply to an Email I sent on our behalf. Sounds like something we can all get behind.
Thanks again to Rado..

Thanks for your email. I would be happy to take on the R-75 mods. Any details regarding the S meter and AGC mods would be appreciated.

We would require an R75 here at Kiwa so we can go over the receiver, make some measurements regarding the filters etc. We would be happy to perform any desired mods if you were to send one here. Our policy is that we do not charge for labor, only parts as required for receivers that are used as test models for any upgrades. This allows us the opportunity to test new receivers without the expense of purchase. It also saves money for the customer.

Let me know if this sounds like something you would like to do. The schedule here is very busy with Christmas orders, so we would not be in a position to do any upgrades until after Christmas.

Kind Regards,

Craig/Kiwa

140. Synch AM vs ECSS

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-01 22:30:53 UTC
From: dschre@goodnet.com
Topic: 140 Message: 140

With my R70, I've become accustomed to using ECSS since the receiver doesn't support synch AM. The question arises: does ECSS provide most of the benefits of SAM or not?

I want to purchase the R75, but am not sure that initially I would do the mod if I could get by with ECSS. Would I be reasonably satisfied with ECSS for digging out the tough DX on AM shortwave, since I'm fairly adept at using it after years with the R70? Technically speaking, what do we give up by using ECSS instead of SAM?

Thanks for any advice.

I havn't made the mod yet, so I do a lot of ECSS am listening. It
works great for me.

Topic: 140 Message: 142

I'm happy ECSS works great for you, K. but that was not the question.

A well-designed S-AM circuit, that is a good lower AND upper sideband S-AM synch detector (à la Sony ICF-2010, Drake R8B...) eliminates interference from adjacent interfering stations, 'clarifies' the signal you want to listen to, AND usually maintains or even improves the (very relative) 'fidelity' of that AM signal. It shouldn't degrade things, if it works as supposed (?!).

ECSS does a bit the same and is a GREAT tool to have, but inevitably sometimes affects the 'natural' sound of the AM voices since it's SSB, and the narrower bandwidth doesn't exactly reproduces the same quality of voice the 'carrier signal' has. My ears can tell the difference. I also 'feel' that ECSS doesn't always TOTALLY eliminate the adjacent unwanted station. You can get close by using a still narrower filter, but there it goes down the drain whatever 'fidelity' was left. I had the 2010, a Drake now, an R75 in transit that I plan to (have somebody else) modify using Rado's 1.1 AGC/S-AM mod.

Besides, having to ECSS often and manually adds some extra steps to the tuning process. Fortunately you can now set stations AND settings in memory (like in the R75) and just recall them when you want. S-AM is quite straight: just hit a button, that's it usually, you need little 'fiddling' with the other radio controls (PBT, etc.). In other words, it's nice to have, IMHO.

Hope it helped. If I said something very wrong, please fellows correct me. I'm open-minded, and certainly not an expert.

From: jjga@usa.net
Topic: 140 Message: 143

I forgot to state: I use ECSS myself quite a bit, don't take me wrong. I only have S-AM in one Rx now, I HAVE TO go the 'exalted-carried' way often, and I like it. But the 'ex-musician' in me can tell a 'certain' audio quality difference that usually goes in favor of S-AM, when all other factors are equal. That's what I meant to say. Besides, sometimes S-AM alone doesn't cut the mustard, you need.....TO ECSS quite a few signals! It's nice to have both...working well. :-)

Thanks for all the observations.

I also wondered after reading more recently about how SAM works, whether SAM compensates for signals that drift (on the transmitting end, not receiver drift). At times I find with ECSS that I have to fiddle with the RIT to keep the signal listenable. I thought the explanation was that SAM could "track" the signal better, if the frequency shifted somewhat.

You're welcome.
>
> ...At times I find with ECSS that I have to
> fiddle with the RIT to keep the signal listenable. I thought the
> explanation was that SAM could "track" the signal better, if the
> frequency shifted somewhat.

That's what 'locking in' the (S)AM signal is and does, it works against 'fading', keeps reception of the frequency more 'stable' (when it's 'good' and doesn't lose hold of it), less 'drifting', thus more 'readable' than, you're right, with ECSS sometimes. But we are talking here about a good, single-sideband-capable synch detector, not the 'primitive' ones like those in the R75, Drake R8 & R8A (the R8B has a nice one!), etc. that can't discriminate SB (sidebands).

Talking about that, I almost can't believe other notable companies still haven't been able to 'duplicate' (to put it that way) the 'performance' of the original <$500.00 succesful detector of the ICF-2010 which starting selling (and still is!) ¡¡¡15!!! years ago. Shame on you, Icom. Hope 'they' read this. My gut feeling!

From: Gert Nilsson
Topic: 140 Message: 146

S-AM is better than ECSS on clear channel with weak signals or signals effected by fading. However the ECSS is very good on the R75 with the 1 Hz resolution. You can't tell the difference on speech. Of course music is better with S-AM

When it get really tough with a lot of close in interference S-AM is not good at all. It always locks on the strongest station´. This is especially so when you have this kind of S-AM with a large lock-in-range. Lock in range of the R75 is +/- 3 kHz. If I listen on 1600 kHz for a US station and have the Colombian on 1600,08 It always locks on the strongest carrier. On my R71 with a +/- 30 Hz lock-in-range phase locked AM circuit I can put it in USB with 2,8 kHz filter and lock to the Colombian, even if it is weaker

Perhaps there is a possibilty to narrow the lock in range of the Sync AM in the R75 making it useful even for hard to get stations.

This discussion thread has been very useful for me.

Another tack - would the addition of a Sherwood SE-3(?) to the R75 be a cost-effective move? And is it generally considered a worthy unit, based on your observations about the R8B and the 2010? Somewhere I remember reading that the IF output on the R75 made the use of the SE-3 a little more complicated than on other receivers.

148. R75 with makeshift antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-03 20:00:38 UTC
From: Gerry Busch
Topic: 148 Message: 148

Since my outdoor active antenna is permanently mounted too close to the computers in my home office and the weather is too cold right now to go out and move it, I recently relocated my ICOM R75 to the living room. The problem then was to find a suitable temporary antenna. There's about 50 feet of 75 ohm coax going through the living room wall and running under our mobile home (on blocks, no foundation). Some of the cable is even coiled up and lying on the ground; it comes out at the utility post where our phone junction box is mounted. As you may have guessed, the coax is for cable TV. We cancelled our cable service quite a while back, so the coax is totally dead. I therefore hooked the living room end of the outer coax shield to the antenna connector of the R75 (nothing to the ground connector) in an attempt to create a makeshift random wire antenna, and decided this would have to do until I could relocate the outdoor antenna.

Well, not only does the coax setup work, but it works better than the active antenna, and is almost as broad-banded, too. In fact, yesterday I discovered that skip conditions were bringing in strong FM signals between 30 and 40 mHz from fire departments 1500 miles or more away from me. Until then I had written off those frequencies as short-range ones that are not in use in my area. Signals in all the HF bands are about the same strength as before, but the background noise (esp. from the digital stuff in the office) has dropped significantly. Now I may not even bother moving the active antenna at all.

At any rate, the R75 made it possible, because the coax shield didn't work as an external antenna for my other receiver (the Sony 2010).

Gerry

Hello list,
I am beginning to know to the rx.
In my Yaesu FRG8800 the technique works very well, but in the R75 it is not very remarkable.
Can I be mistaking the procedure? is different in the R75?
I don't really like the manual, I am not a newcomer in SW but I would not like to be it to understand this manual.

Hi R75ers !

Ken has been very illustrative!

For default the R75 this is:
For 9MHz/455 kHz
AM Normal 15 6
AM/N 2.4 2.4
AN/W 15 15
SSB 2.4 2.4
SSB/N Off
SSB/W 15 2.4

And in the manual he gives as example:

Normal 2.4 2.4
Narrow off 2.4
Wide 15 2.4
It doesn't specify MODE

Does somebody want to indicate their combination of filters that they are
those included in the rx (not optionals) ?
What is best choice according to the MODE ?
Thanks in advance
73?s
Enrique

153. rado mod v1.1 update/report

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-06 03:31:14 UTC
From: yuf@phoenixdsl.com
Topic: 153 Message: 153

Well, I have to rave about the update. The S-AM is so completely useful now. I must heartily recommend the mod, but repeat earlier warnings.

Warning story: I broke pin 23 completely off, and had to resort to some guerilla hacking to attach a trace and finish the mod.
All has turned out well, but I was certainly over my head.

BTW, I'm using a 10kOhm resistor with great results.

Also, I'd like to tell everyone that I discovered that those little tiny tweezer like probes used by hardware guys on chips can provide a wonderfully unintrusive way of doing this without solder. I'm using them on both pin 3 and 4 now with no problems. Essentially just clamp onto the pin in question.

Solder most certainly makes a better connection, but this makes trying out the AGC mod a virtual no brainer for the solder inexperienced.

154. Homebrew Computer Control?

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-06 18:48:07 UTC
From: Scott Robson
Topic: 154 Message: 154

Hi Everyone

I recently purchased the R75 radio with the computer software. I don;t expect delivery until mid December by which time I will have left for a one month vacation. Anyway in the mean time I have begun to think about the computer control software and whether it is possible to write our own software for it? Are the command codes known? Is this just a crazy idea or is it possible?

I ask this because if it is possible, I'd like to co-ordinate an effort to do just this. So if you are interested in pursuing this idea, email me and let me know! If you don;t care, you can stop reading now :)

OK, for those interested. I must warn you, my programing skills are not great, but I consider myself competent enough to be able to learn more and tackle this project. I am also skilled only in programing in the Linux environment with C and gnome/GTK. This does not mean there can;t be two efforts, one involving a windows program and one involving a linux version. Code can be swapped between the two projects Im sure. I have no idea how good the ICOM software is, but usually there is room for improvement. I have noticed the winradio team have really put alot of focus on unique ways to program their units and many users have come up with loads of interesting little programs to do cool stuff, like auto-recording to hard-disk of signals and automatic decoding of RTTY etc. If it is possible with the R75 I'd like to try.

So if you are interested please email me and let me know. I will be travelling until Jan 16th at which time I will get back to home base and will be able to start playing with my radio. I can still read my email while I'm away. In the mean time, maybe those who are interested can start throwing some ideas together. Those who are not interested and are still reading, feel free to tell us what you would like to see added to computer control software. I'll look forward to hearing any interest in this idea.

Scott

AM normal 15 6
AM wide 15 15 (a little too wide)
AM narrow 15 2.4 (much too narrow)

SSB normal 2.4 2.4
SSB wide none -- (really need optional filters here)
SSB narrow none --

With optional filters
AM narrow 15 3.3
SSB wide 2.8 3.3/2.8

I would be very interested in getting a Linux interface working
for this. I too have some experience with C and general unix
programming.

Per your question about the specification, check out the manual and
you will find the data types on page 40. It looks like a fairly
simple protocol, but I haven't studied it enough to know how complete
it is.

This is a good sign! I have since done some web browsing myself and have discovered another product (shareware) for controlling the radio under windows. Maybe a further windows controller is not really needed (unless people really want a freeware one).

Anyway I agree with you Yuf, a Linux interface would be a great idea. Any linux heads out there wanna help out? Please email me and Yuf.

Other members of the list, please feel free to contribute to the project. Your input regarding features you would want to see will be greatly appreciated. Until I have a good read of the manual, I wont really know what can actually be implemented, but any idea is a good idea and can be worked on.

Scott

Scott,
That is a great idea!
Although it likes me a lot to the Smart Icom of Mark Fine, it is very good
for those that want to have more options.
In the manual they figure many commands I believe they should be useful.
It hurts that I don't know anything about programming.
Hopefully those that know help.

TO Mark TURNER

Hi Mark, Hi listmembers

I read with great interest your posting about IC-R75 and AOR-7030+
A friend of mine is about to purchase one of these recievers but he
still doesn't know which one to chose... His main interest is NDB
DX'ing (NDBs are these beacons transmitting CW in the range 285>450
KHz approx).

So it could be very nice if you could try to catch a few of these NDB
and tell me the difference between both sets. I know AOR-7030+ is
very sensitive for LF listening but I was told R75 was not too bad.
As you can run both receivers side-by-side there's no better way for
my friend to make up his mind.

Sorry for my english and many thanks for your help.

Pat in the French Alps

161. MP3 plugin for receivers?

I have had my R75 for about 3 weeks and it appears that the clock is losing time. I set it on wwv (dead on) and now it is about 15 seconds slow. The radio is kept in a controlled environment so I don't think it is a temperature thing and I'm pretty sure that wwv is pretty stable so, what's the deal? Has anyone else noticed this? Thanks for any responses!

I just joined the group. I never knew it existed until I saw a reference to it on Monitoring Times Chat Board. Looks like a great resource. I am anxious to catch up on past posts, especially regarding the sync detector performance (or lack of.) Like many others, I am disappointed in the sync detector's performance, especially given the price of the receiver and ICOM's reputation in the market. The sync detector on my Drake SW-2 was heads above the ICOM's. I have had my R75 with DSP and the stock filters for about three months now and am having a ball with its many features. I have started "listening" in on PSK31 comms on the ham bands using Digipan as well as listening more to utility comms. Until next time, 73s.

165. UT-106 DSP Install Instructions Incomplete?

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-09 19:26:16 UTC
From: Rich
Topic: 165 Message: 165

Hi,
I bought my R75 just before Thanksgiving and am really enjoying it. This is my first receiver since the 1960's so I don't have any recent/valid comparisons. I got the DSP unit (UT-106) yesterday and installed it today. It seems to work well (it is quieter on AM). I do have some issues with the installation of the DSP.
The installation (based on the IC-R75 manual) is (I believe) incomplete. I work with computers so I have only minor (cautious) hesitation when adding/removing equipment. Perhaps some of you are more adept at interpreting these instructions - more power to you.
The specific steps that need clarification are in the UT-106 DSP install on page 35 and numbered below.
2) "Remove the shielding plate." If the drawing was not present/hadn't taken of the bottom cover I would not have easily found this (i.e.,it is not labeled - I matched up the shape, drawing to actual shield).
3) " connect the cable to J1 on the UT-106." Well, I could not see the J1 marking anywhere on the UT-106 (perhaps it is covered up on my unit - but it was the only connector that matched). I also had some difficulty removing these connectors - they appear to have a small locking tab. I used slight pressure, applied to a slot in it's side, from a very small screwdriver to release it from it's socket.
6) "Attach the Velcro tape as shown at right." After attaching the Velcro and fastening the DSP to the main unit I noticed that the flat cable, at the connection point to the DSP, was askew. In attempting to seat it I found a solder joint that resembled a blob that had pushed the cable aside. I gently lifted the cable, above this blob, and seated it fully. This could just be on my DSP board but feel you should know in case someone else encounters the same thing. Is this poor soldering? I don't know.
The last thing I encountered was in replacing the covers (bottom & top, in that order). After sliding the bottom cover into place and replacing it's 2 screws I proceeded to install the top cover. The top 4 screws went in fine. The 4 side screws (2 for each side) did not properly align. Working backwards I removed the top cover and examined the bottom cover while it was still attached. Apparently I had slid the front of the bottom cover in place while the back was not fully in place (i.e., flush). I removed the screws, seated the cover so it was flush, and reassembled the rest of the unit successfully.
To further obfuscate the installation I had one part left over. It is not mentioned anywhere in the page 35 installation instructions. The UT-106 did come with it's own instructions for 2 other receivers called the IV-706MKII and the IC-PCR1000 in English and Japanese (?).

Apparently this is an "Insulating case" used only with the IC-PCR1000. Hmmm - this I should know? I troubles me to have unidentified parts left over. I presume I have solved this problem.
I don't think (IMHO) that I am nitpicking when it comes to enhancing something this complicated - especially if this is unfamiliar territory (as it is for me).
I hope this helps someone else facing the same/similar situation - good luck to all (but most of all have fun!).
Rich
ps - My compliments to Rado for having the skill/guts to go in the box and solder the S-AM fix. I would love to have that feature working better but will not risk doing damage in such tight quarters.

Thanks Rich, I have printed your comment out and have added it to my manual. I don't have the DSP. But if I add it I will have your email by my side.

Mine is an early R75 that was bought before Icom offered the free DSP. Hoping they would reward "early buyers" with atleast a discount (after all if not for early buyers on a new model where would the company be???) I called them and ask how much would a DSP would cost me.
They quoted me a price higher than their "a ???? value" price in their adds (actual price in adds escapes me now). They wanted $170 for the DSP. Now in reality I admit I didn't actually do the early buying of this radio. Someone else did and then I ended up with the radio. Point is Icom doesn't know this. they don't know the other person gave the radio to me. As far as they know I am the orginal buyer of the radio and want to charge me $170 for the DSP. Go figure.

I love my "75". Have about 10 high end radios and am more impressed with the 75 as each day goes by. Great for Digital decoding. I am decoding a surface fax from the U.S. Airforce right now with it. No fidgiting around with the freq. and filters like I have to do with the R5000 or R71A or NRD525. the 75 almost takes the fun out of digital decoding it is so fast to set up. (put it on freq., push the fax button, turn on the M7000, push the fax setting, turn on the monitor, ...bingo.....instant fax....I've never had it so good!)

Sure would like for Icom to atleast let me buy the filter for what their adds say it is worth though, instead of more.

167. TO 7030+/R75 owners

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-10 09:06:49 UTC
From: aunumero13@aol.com
Topic: 167 Message: 167

Hi all,

To the listeners who have both AOR7030+ and IC-75 (with the optional DSP) :

Could you please try to catch a few NDB (NDB are these beacons transmitting CW in the range 285 > 450 KHz) and run a side-by-side comparison.
I'd like to know if there's a big difference between both sets (the specs shows a better sensitivy for AOR there).

Please select *weak* signals. Are there weak NDB that are audible on one RX and not on the other ?

If I'm right R-75 has a built-in NOTCH filter and 7030+ has not...(you have to add the NB7030 that is a bit expensive...). what do you think of it ?

It may help a friend of mine who is hesitating between both sets (and, as you probably guessed, his main interest is NDB DX'ing - He's using a Wellbrook ALA-1530 antenna)

Your comments would be most appreciated.
Many thanks for your help.

Pat, F8AIH.

I cant't help you with the comparison of the sensitivity between the 7030 and the R75 in the LW band, but I think it will be good enoygh ewith the attenuator removed. At higher frequencies the R75 without the preamplifier has about the same noisefloor as the 7030 with a preamplifier!

The Automatic Notch filter in the R75 is a good one, but you should nor rely on it for NDB reception. It will for sure reduce the 1 kHz from a close in channel but as it is automatic and notches several tones it sometimes reduce the 400 hz tones from the wanted NDB!

> As you can run both receivers side-by-side there's no better way for
> my friend to make up his mind.

Sorry I haven't had time to do a proper comparison, but I just had a quick listen for half an hour or so. Used an ALA1530 facing 20/200 degrees, comparing my AR7030+ (no DSP but extra SSB filter that shows up as bw2.1 and does make a small improvement on cw over the standard that shows up as bw2.3) with my IC-R75 (standard, no DSP yet as that's wrapped up as an Xmas present) I compared about half a dozen beacons, played with the AGC, played with the pre-amp and attenuator settings to get the clearest signal on each receiver.

I think the two receivers are very closely matched down there but felt that the R75 might have been slightly clearer on some signals. I *think* the R75 is slightly more sensitive down there without being so hot that intermod happens unless you choose pre-amp level 2.

The R75's ease of use, i.e. everything is there in front of you without having to wander the menus, seemed to help as it allowed quick and easy access to things like pre-amp, attenuator, pass-band-tuning, etc., whilst trying to make the weaker signals clearer. The AR7030+ could do either the same job or at least very close, but it took a bit more fiddling around with menus to get there. For straight utility/ham SB reception I prefer the AR7030+ as I don't need to fiddle with many settings and the tuning knob is, to my mind, a better weight and "smoother" but for 5.68MHz USB monitoring for example I would use the IC-R75 as the squelch is much easier to get to and seems to work better.

I did notice a difference in frequency readout between the two receivers for the same cw note. Not knowing where the beacons were s'posed to be I don't know which is more accurate. Also, not being a cw fan (yet) my ears don't know what note is "normal".

I don't know whether the noise reduction side of Icom's UT106 would help, but Santa won't let me play with that yet.

Sorry the above isn't very scientific but I hope it's useful.

Cheers,

Mark.

Gert and Mark,

Many thanks for the comments on AOR-7030 and R-75 !
It is very difficult to chose between both receivers... on one hand, AOR seems a bit better but on the other hand it's much more expensive (about 30 % if we add a notch + external DSP)...

<< At higher frequencies the R75 without the preamplifier has about the same noisefloor as the 7030 with a preamplifier! >>
It means R-75 is more noisy ... and that reception of weak signals may be easier with 7030+... the more I learn about these receivers, the less I know which one to chose !
If both sets cost the same, I would probably purchase a 7030+.

If we only consider the LF performance, I suppose AOR is better, but for the same price we can get a R-75 fitted with with a narrow CW filter, its DSP unit and its in-built notch...
Gert hints that noise level is better on AOR, but what about the R-75 with the Noise Reduction ON ?

<< Sorry I haven't had time to do a proper comparison, >>
Well Mark, if you have more time in the coming days, could you please run a few more side-by-side comparisons with these NDBs on LF band ? I also have ALA-1530 (ALA-100 too !) and it is very good for NDB DX'ing. (I heard several beacons more than 4000 Km away on LF with it).

Thanks,
Pat.

Lower noise floor means a more sensitive receiver. The internal noise is lower! In other words: The R75 without the preamplifier is as sensitive as the AR7030 with the preamplifier, especially on higher frequencies! Below 1,6 MHz the R75 has an attenuator which I have removed. I have tested my R75 side by side with an AR7030 on shortwave and on teh really hard ones, both my r75 and even my oldd R71 And Collins R390A offered better reception than the 7030. However as soon as the signal is a little stronger the AR7030 has an exceptional audio quality!

Hello Gert,

Curious to know how easy it is to defeat the Attenuator
below 1.600 MHz on the R75 ?

Is this a hardware or software function ?

My Kenwood TS-440 had this too. Apparently to block
interference from strong local broadcast stations.

Thanks for the input....

It is very easy to defeat the attenuation below 1.6Mhz -- I published the change needed
last spring. Its an easy solder bridge on the board --- ICOM provides a pair of pads that just
have to be jumpered. Do a search on r.r.s.

Thanks Don,

I have had mine for a short while and it is good to
know about this. I am trying to pick up a local NDB
about 10 miles away and have not had any luck.

Maybe this will help.

Hi Don,

Could you please upload the <1.6 MHz attenuator mod in the "R75 mods" folder
of the group?
This will save some time for many of us.

Thanks!

Rado

From: jjga@usa.net
Topic: 181 Message: 181

Group,

I noticed yesterday that when you are in NAME mode for any memorized station you CAN'T change the frequency (because logically for the software 'you can't see it changing'), but if you touch and HOLD the TS button you are able to do so AND TUNE IT AS DESIRED using the main knob and most probably two hands --not a very confortable task unless for sporadic 'close-by' frequency-changes' only.

Releasing the TS button again takes you back of course to NAME mode and leaves the frequency NOT in its original 'memorized setting' but where you last tuned it to. If you want to recall the setup memory again you then have to use the conventional method. It's possible most of you have tried it already.

It's simply --nothing more-- nice to know for people (not me) who prefer to have the NAME function on most of the time. This way at least they don't have to hold the SEL button 2sec. to go to the frequency display, tune that memory, then hit SEL 2sec. again to revert to name mode once more.

Please don't flame me if this happens to sound stupid to you. I just setup my R75 this week and started 'discovering' things like this one. I don't think it's in the manual, maybe yes (?!). ;-) Was it posted before?! I didn't see it, sorry.

Thanks,

J a s o n

Hi Jason,

Thanks for the nice tip!

I'm also keeping my R75 in Freq. mem. mode. Wish there was a button which while pushed to show the name for that channel ... or much better iCOM could have added a separate dot-matrix part in the LCD for the alpha tags ... and also clock digits.

Best regards,

Rado

rado and the rest of us R75ER'S: it is a heck of a radio and one of the best deals dollar
wise i've ever encountered.i have not installed the dsp yet and am very pleased with the radio as it is. but i will have the synch mod done and if it makes a big difference have the dsp. when i'm using am mode sometimes i switch to LSB and it comes in with out fading away. thanks and this is the best board for a single radio group, in my opinion.

From: Gert Nilsson
Topic: 167 Message: 184

This is a hardware operation. Close to the antenna relays there is a connection point (CP in the schedule). It is a copper area in the shape of a small circle, divided into halves. Just bridge the small gap!. It is very easy to check. Just use a screwdriver to make a connection. This shortens out a part of a resistor network. Still a resistor to ground left. Perhaps sensitivity will be even higher if you remove this resistor. I have not tried. Don't think you need it.

Hello Gert,

Curious to know how easy it is to defeat the Attenuator
below 1.600 MHz on the R75 ?

Is this a hardware or software function ?

My Kenwood TS-440 had this too. Apparently to block
interference from strong local broadcast stations.

Thanks for the input....

185. MP3 rec and HF receivers Explanation !

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-11 11:41:29 UTC
From: Zacharias Liangas
Topic: 185 Message: 185

Ohh.. I see that none has responded inth is question so let me reintriduce the idea

As i told you before this period except DXing (you will see my logs in the hard core DX list) i m involved with MP3 co-decoding as standby mechanisms players etc (derived after i encode my music collection and seen the small magic MP3 players , some of whom have the ability to enode directly from FM)

The idea can be very simple . IF someone instead of using a tapee recorder connected to R75 for a TIMER recording- (two cables one for audio and one for remote control) , it could surely have a small plug in recorder inside the radio and record at the time you wish
It can also record say a RTTY signal for say 30 minutes and then using the external computer to decode the 'digital' data.
This is the whole idea

What is your opinion as an idea? (regardless of the cost of the 'plug-in' recorder player)

Hello Radostin,
as regards the Synch Detector ? have been looking at the insides of my Radio and located everything with the aid of a magnifying glass and your file pictures ! could you not please make the three mods seperate ,and make each mod on its own sheet ,because its very confusing to anyone who is a layman ! I can use a soldering iron!!!!
however if you would kindly rewrite each mod seperate without parcelling them up
together eg AGC-SYNCH- and your latest mod it would be a lot easier for us that are
not techically as clever as some other's ! 3 seperate mods = 3 seperate instructions
each stating from scratch! why I ask for this is because it seems to me if a person just
wants to do the SYNCH MOD like I do and looks at your mods coupled with AGC its so confusing that Im'e trying to figure out what are all the wires in your pictures ? and how do you connect to the ground wire ????i would be grateful if you would please let me know how to do the SYNCH MOD on its own without all the other bits and bobs that where added doing the AGC mod ?
Thank you
Tony Berry

Hi Tony,

> could you not please make the three mods seperate
> ,and make each mod on its own sheet ,because its very confusing to
> anyone who is a layman !

Sorry, I don't have the time to do that. Here is what you should do for the
synch. mod only.
Follow these steps in the mod Ver. 1.1 instructions:

step 1 - open the R75 and find the place
step 3 - only the part about the ground wire (the gray wire in the picture)
steps 5, 6 - synch. mod (magenta wire)
step 9 - finishing the mod

That's it.

> I can use a soldering iron!!!!

Are you sure? Do some training on a scrapped PCB before performing the mod
on the R75.

Best regards,

Rado

Anybody who has it installed?

How does it work, is the speech good?

I think it would be useful to time stamp recordings etc so is the speech also on the rec out?

Björn D , Sweden

190. First impressions R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-17 00:09:25 UTC
From: Jem Cullen
Topic: 190 Message: 190

Well.

In a moment of weakness i splashed out yesterday and bought an R75. Used it all last night and a little this morning side by side with IC740 Txr and Sangean ATS803a. I used to own a Kenwood R5000 so I was keen to see how it went.

Frankly, I'm very disappointed, almost wonder if I can get my $$$ back! I actually found the 803A better at times.

When listening to a weak signal 5-10khz away from a stronger one i find the Icom falls apart giving a horrible mess, but the sangean is clearer. The wide bandwidth is too wide for any use and even the 6kHz is too wide, leaving me to use the narrow which is too narrow for swl/dx. ECSS is ok but shouldnt be that necessary.

set the filters to wide 15 15
medium 15/6
narrow 15/2.4 (found 2.4/2.4 too narrow)

THe sync just does not work. The only other sync detector i have used was on similarly priced Jrc 345 and onthe 345 it was spectacular! tuned to a weak/fading staion, hit sync and it was like Hi-fi (well... ok im exagerating, but it was remarkable) The sync was waaaay better then ECSS! but on the r-75 its only a light!

The AGC is the weirdest thing i ever seen, the fast is too fast, and if I turn the AGC off altogether the radio overloads horribly, in fact strong stations (0ver S6) just disappear altogether causing the rig to mute! Does everyones do this or do i have a dog? Can some of u guys test this and let me know?

The audio is Ok but not great and the preamps (esp amp2) make the audio very harsh.

I set the clock by WWV yesterday, this morning it was about 7 mins fast! (however I spose I could of done something when i was learning all the controls, dont think so tho. I corrected it and will see tomorrow)

In its favour it is quite sensitive in SSB, but i could not find one signal on the r75 that i couldnt find on the 803a, just clearer on the r75.
The Noise blanker works well, pity its not adjustable like on the R5000.

Because the r75 cost me almost 2 weeks pay (AU$1500-ish)I couldnt afford any options(filters eaach about $120), and in Aust you dont get the DSP free offer (AU$150). So its a plain vanilla R75 with no extras, and i wish i had of waited for a used R5000 with a few filters for half the cost.

Ok so I can do the Sync mod here -and i will have to, it seems... but im terrified coz its soo delicate. However i feel that to pay so much for a rig that has trouble outperforming an 803A, is a worry. It seems I paid thru the nose for a box that gives me the honour of paying about a third more again to make it work properly ($400+)! (if im willing to poke inside it with a soldering iron, and risk voiding the warrantee)

I wont be able to afford options for a few months at least so I paid all that money for a marginal improvement and in some cases lower performance then my 10 year old AU$250 portable.

keep comparing and your dream state will be over.you must have gotten the
worst R75
that icom put out. are you listening just to world band and a.m.??? if so,
well yeah i kind of see
your gripe. k9jj.

yeh, well i thought it would compare better!
i kinda hope i did get a bad one, coz then i can get it replaced/
fixed/refund! but i suspect its wot it is.

still curious about that agc function.... basically with agc off it
mutes on even s3 or better, and weaker ones cause it to fall into
digital hash!

in its favour, i do a lot of rtty/fax and it works quite well then.

first impessions are important, and this one has failed to impress

anyone wanna buy a r75? only 2 days old?

Hello Rado,
re your STEP3 QUOTE!!!! ground wire in picture see grey wire
solder one end to near screw of pcb "this is ground"
Okay exactly where does the other end attach it self too?????
it does not show in picture? re grey wire ground
Regards
Tony.

195. Re: [icomr75] First impressions R75

Topic: 190 Message: 195

Jem,
Despite your poor first impressions, the R75 is a rip-snorter when properly kitted out and driven properly.
If you want to give it a go I would suggest the following be put on your shopping list:

FL-223 (1.9KHz) Filter for the 9MHz IF (1st priority).
UT-106 DSP (works well in most instances)
FL-257 (3.3KHz) Filter for the 455KHz IF (While I don't have this one yet I intend to install it as others have had success with it for a better [not too wide/narrow] for AM).

As yet I have not done the mods but will do so when the madness of Christmas is over - my hands shake too much after being out in the traffic at the moment (Hi!).

Also, try a 2.4 + 6 for the IF filter combination.

DXing in the so-called ECSS (Exhalted Carrier Single Sideband) works well for me in the absence of Synchronous Detection. Get used to the IF passband controls and you will be surprised what you can do, even with a 2.4 + 2.4 IF).

All in all, the R75 needs to be driven almost all the way but will give performance favorably comparable to the more expensive rigs.

If you still want to get rid of it then I suggest you go to http://matilda.aaa.com.au/dx/ which is the site of the Australian Radio DX Club and go to the Classifieds - I think you should get a taker before long; or at least after peoples' budgets recover post-Christmas.

Hope this helps

Ian Johnson

Subject: [icomr75] First impressions R75

Well.

In a moment of weakness i splashed out yesterday and bought an R75.
Used it all last night and a little this morning side by side with
IC740 Txr and Sangean ATS803a. I used to own a Kenwood R5000 so I was
keen to see how it went.

Frankly, I'm very disappointed, almost wonder if I can get my $$$
back! I actually found the 803A better at times.

When listening to a weak signal 5-10khz away from a stronger one i
find the Icom falls apart giving a horrible mess, but the sangean is

clearer. The wide bandwidth is too wide for any use and even the 6kHz is too wide, leaving me to use the narrow which is too narrow for swl/dx. ECSS is ok but shouldnt be that necessary.

set the filters to wide 15 15
medium 15/6
narrow 15/2.4 (found 2.4/2.4 too narrow)

THe sync just does not work. The only other sync detector i have used was on similarly priced Jrc 345 and onthe 345 it was spectacular! tuned to a weak/fading staion, hit sync and it was like Hi-fi (well... ok im exagerating, but it was remarkable) The sync was waaaay better then ECSS! but on the r-75 its only a light!

The AGC is the weirdest thing i ever seen, the fast is too fast, and if I turn the AGC off altogether the radio overloads horribly, in fact strong stations (0ver S6) just disappear altogether causing the rig to mute! Does everyones do this or do i have a dog? Can some of u guys test this and let me know?

The audio is Ok but not great and the preamps (esp amp2) make the audio very harsh.

I set the clock by WWV yesterday, this morning it was about 7 mins fast! (however I spose I could of done something when i was learning all the controls, dont think so tho. I corrected it and will see tomorrow)

In its favour it is quite sensitive in SSB, but i could not find one signal on the r75 that i couldnt find on the 803a, just clearer on the r75.
The Noise blanker works well, pity its not adjustable like on the R5000.

Because the r75 cost me almost 2 weeks pay (AU$1500-ish)I couldnt afford any options(filters eaach about $120), and in Aust you dont get the DSP free offer (AU$150). So its a plain vanilla R75 with no extras, and i wish i had of waited for a used R5000 with a few filters for half the cost.

Ok so I can do the Sync mod here -and i will have to, it seems... but im terrified coz its soo delicate. However i feel that to pay so much for a rig that has trouble outperforming an 803A, is a worry. It seems I paid thru the nose for a box that gives me the honour of paying about a third more again to make it work properly ($400+)! (if im willing to poke inside it with a soldering iron, and risk voiding the warrantee)

I wont be able to afford options for a few months at least so I paid all that money for a marginal improvement and in some cases lower performance then my 10 year old AU$250 portable.

Hi Tony,

If you want to perform only the synch. mod then:
- Lift pin 23 (step 5)
- Solder a wire to the lifted pin 23
- Solder the ground wire next to the screw
- Solder a 100 uF (15V or more) electrolytic capacitor between the other ends of the wires. Positive (+) leg goes to the wire from pin 23, negative (-) leg goes to the ground wire.

See the schematic in the mod instructions. You should have only C2. The resistor and C1 are for the other modifications.

Still I strongly recommend the AGC mod. It improves the things a lot. I don't know how the synch. mod alone will work - I've tried it only together with the AGC mod.

Best regards,

Rado

Hi Jem,

> When listening to a weak signal 5-10khz away from a stronger one i
> find the Icom falls apart giving a horrible mess, but the sangean is
> clearer.

This can happen if the NB is on. It gives a lot of distortion in the presence of strong signals. Turn the NB off! There is a precaution about this in the manual (page 15 in mine). Also there is also a set-mode option which can turn off the NB for AM mode. Use the NB only if there is a pulse-type noise (like from passing cars etc.).

> The wide bandwidth is too wide for any use and even the
> 6kHz is too wide, leaving me to use the narrow which is too narrow
> for swl/dx. ECSS is ok but shouldnt be that necessary.

Agreed. I'm thinking of replacing the 15 kHz filter (Murata CFWS450E, 15kHz/6dB 30kHz/40dB) with a 4 kHz one (Murata CFWS450IT, 4kHz/6dB 15kHz/40dB). I'm not using the 15 kHz filter at all. After the replacement I'll have a narrower bandwidth then the 6kHz for S-AM (it is not possible to select the optional filter for S-AM ... STUPID!). If only somebody can send me one of those (they should be cheap ... about $5 or so) - I tried Murata Japan but no answer. (I don't know Japanese ... and maybe they don't understand English :-)

Yes, it does not. R75 is VERY clean in SSB. If a receiver is better in synch. AM than in ECSS (at zero beat) then it means that it's poor in SSB. Synchronous AM gives only the convenience of automatically zero-beating the station ... and following small carrier drifts. Also a little bit better S/N ratio if both sidebands are utilized.

> The AGC is the weirdest thing i ever seen, the fast is too fast, and

> guys test this and let me know?

The AGC is not very good in AM mode. That's why I've developed the AGC mod. In SSB the AGC is very good. If you turn off the AGC then you should manually adjust the RF gain (with the RF gain/Squelch knob). Why do you think the receivers have AGC? There is no RF stage (without AGC) I've head

of with 120 dB dynamic range.

> The audio is Ok but not great and the preamps (esp amp2) make the
> audio very harsh.

Preamp 2 is for the upper bands. It intermodulates in the presence of strong signals (in the lower bands). Again check the NB is off!

> I set the clock by WWV yesterday, this morning it was about 7 mins
> fast! (however I spose I could of done something when i was learning

> tomorrow)

If it drifts with 7 min/day - ask for replacement. It's defective.

> Because the r75 cost me almost 2 weeks pay (AU$1500-ish)I couldnt
> afford any options(filters eaach about $120), and in Aust you dont

> filters for half the cost.

My R75 cost me $1000 US here in Japan (with DSP and FL-257 3.3kHz). I'm still very happy with it. I used IC-756 trx (IF DSP etc.) for DX-ing before the R75. For me the R75 is much better for DX-ing. The audio is much cleaner. Well, IC-756 had a nice real-time bandscope ... and dual receive.

Best regards,

Rado

198. R75...getting to know you...

Yahoo group: icomr75 (2000 — 2002)

Topic: 190 Message: 198

Hi Rado and everyone.

As I said in my email, these were my "Initial thoughts", after a few days its starting to grow on me, tho I still believe its not as good as it could be. I must admit Im mainlya ute/digital listener, more then SWL/Broadcast DX (a bit of both I guess) and I find that its very good indeed for digital stuff. I love all the setups for shift and carrier tones, and i can see with a few filters it would be a hot-rod!

I downloaded Mark Fines Smart controller, now that is an EXCELLENT piece of work. (almost makes it too easy..like satellite tv hehe)

Still a few funny thingswith the R75. Im still not convinced about that AGC function, Ive owned many radios and this is the only one where turning the AGC off kills the rig (sometimes...sometimes weak signals are much much stronger with agc off). Its got its quirks and quibbles and its stregnths i guess.

BTW, i do have NB off, unless its very necessary,I thought all your comments were right on the button, Rado. The SSB is extraordinary in this radio. I bought the R75 over its competitors because I wanted a good ute rig and was willing to sacrifice SWL quality (if i wanted great SWL audio etc would have bought AOR or LOWE) for filters, etc. and i think on blance I got what i paid for.
And im gunna get the bits for the Sync det. mod today (guess that means im keepin the unit) Tho the thought of doing it and killng the rig gives me nightmares!

This is not a radio that grabbbed me initially, but it certanly is a sleeper that i think i will grow to respect then love. I just kinda resent havein to fork out even more $$$, but i guess thats just the way of everything these days.

73 and have a great DXmas everyone
de VK2JEM
Jem
PS the clock must have been something I did, its accurate now (well, as good as one can tell in 2 days) so... I MADE A MISTAKE!

Do I have to have the CI-V converter to control the R75 by computer?
Can I just hook up an RS-232c cable between the receiver and the
computer and use software to control the radio?

Thanks

And having met Mark I will attest that he is very trying indeed :)

Couldn't resist...

Great program. Spoils you for using conventional rigs.... So Mark, now I need a version for the AR-5000 and the DX-160. :)

No CI-V required.
But they sure make it look that way in the owners guide, don't they !

That all? I *was* working on a version for the R390A, except I can't find a way to keep the actuators from burning out.<G>

Hi Mark,

The only thing that stops me from starting to write control software for the R75 is that SmartIcomControl is already so far ahead - really a masterpiece. The important things to me:
- ILG database support (well, you said it will probably be in the next version)
- Off-line DXing (take more sleep at night). The idea with the 30 timers in the SIC is very nice but why they can only be used when the radio is on? Why not make them active all the time - if the radio is off then it to be turned on with the timers. This is important as it will allow the use of tape recorder or recording software with VOX capabilities. I could be missing something (or did not spend enough time at the Help). Setting the times with a click in the ILG list and then exporting a "timer log" file with the recorded times, freqs., target station info will be of great convenience.

What do you think? Should I fire up the trusty C++ Builder? :-)

If you are interested read my next post about a GREAT recording software I found recently. (maybe old news ...)

Best regards,

Rado

Actually, I hadn't thought of having the program turn the radio on (if it was
previously off) before a timer hit. I'll add that to the to-do list for v4.

From: Radostin Danev
Topic: 206 Message: 206

Hi R75ers,

A few days ago I found a GREAT recording software - RecAll by Sagebrush.
URL: http://www.sagebrush.com/recall.htm

Some of the features:
- "Light" program which does not eat system resources
- VOX capability with adjustable threshold (starts recording only if there is signal)
- "Stamping" the files. Each audio file can have multiple segments. Each segment carries information about the actual time it was recorded. When a file is active starting a recording (or VOX activation) adds new segment. This way each DX-ing session is in one file with many segments. I've already started writing in my logbook the segment in which a station is (one more column). Before I was not recording audio.
- Automatic naming of the files with the date and optional "category"
- MP3 support - yes you can record in MP3 format. I'm using 11kHz/mono/20kbs codec. It gives more than enough quality and requires only about 145 kB/min. That gives about 70 hours per CD (640MB)!!!

For the MP3 recording you need to install the Fraunhofer MPEG Layer 3 codec. More information on this at:

http://audiograbber.com-us.net/codec.html
http://www.sagebrush.com/rectech.htm

If somebody does not have the codec file (l3codeca.acm) I can upload it in the Files section (it comes with Windows ME as standard).

Check this software out - it's GREAT!

(Disclaimer: I have nothing to do with Sagebrush ... just like the software)

Best regards,

Rado

Ok then what will be cheaper - registering Ver.3.24 and then upgrading to
Ver.4 or registering directly Ver.4? :-)

Neither. In-line version upgrades are free to registered users. Ken thinks I'm nuts for doing it that way, but I've always done it that way.<G> Fact is, I hate having to regi$ter and re-regi$ter stuff every time a new ver$ion comes out, so I don't bother to make my customers do it.

Still a few funny thingswith the R75. Im still not convinced about
that AGC function, Ive owned many radios and this is the only one
where turning the AGC off kills the rig (sometimes...sometimes weak
signals are much much stronger with agc off). Its got its quirks and
quibbles and its stregnths i guess.

I think it is absolutely normal that a receiver will be overloaded with the AGC Off. We are talking about signal differences in the range of more than 100 dB. With the full gain on a strong station it must overload!
I agree that the weak stations may be better with AGC off. Often the case when you have a carrier on the frequency making the AGC to decrease the gain! Last night I tuned in to Radio Mallku Bolivia on 4796.47 kHz. It had carriers on both sides within 1,5 kHz so I turned the AGC off, turned down the RF gain and pushed the ANF button and got it readable!

What was it Joannie Mitchell sang?
"you dont know wot u got til its gone..."
(maybe that wasnt joannie Mitchell)

THIS IS A HUGE WARNIG ABOUT RADO'S SYNC/AGC MOD

DO NOT DO IT!!!!

unless you consider yourself an absolute wizard with a soldering rod.. not even very good but Brilliant at it!

Yes this is bitter experience.... yes i did endup with solder not only crossing pins 5 and 6 (slipped off 5 onto 6) but also over about 3 SMD resisters and caps....

spent about about 3 hours to cleaning them all up and i really could not know if i had until i fired it all up at the end. I was sweating and shaking and nearly physically sick! my wife has steam from her ears (you mean u spent over $1000 and 3 days later it needs expensive repairs coz u played inside broke it!!!)

good news is i did clean it up and it seems fine... I finished the mods and it is defn better, but...
of course every static crackle now will mbe a bad solder in the radio now in my mide ..the radio about to die...

im still shaking..

Please guys be honest with urself before u poke around.. pride cometh..
the improvement s good, but its not worth a dead radio.....

my advise if u really want it..pay someone !

well when i thought i had lost it..i realised i loved it

"dont it always seem to go..."

Hi Jem,

Well, I'm glad you managed to fix it.

Did you practice on a scrapped PCB before doing it on the R75? Why so much solder there?

In the instructions I'm trying to explain how to do it with very little solder.

Best regards,

Rado

213. DO NOT PERFORM THE MOD

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-19 12:07:53 UTC
From: Radostin Danev
Topic: 213 Message: 213

Hi R75ers,

I've decided that it will be safer to remove the mod instructions.

The mod appears to be quite difficult. Jem is the second case with trouble (happy ending though). I don't want to feel responsible for damaged radios.

SO PLEASE DO NOT PERFORM THE MOD!!!

The best solution will be for the mod to be performed by a qualified person. Like at Kiwa Electronics.

Best regards,

Rado

214. Photos folder

Yahoo group: icomr75 (2000 — 2002)

Hello Rado,

-I am disappointed to hear that the modification instructions
are being removed. However, I can understand the position of
responsibility you are in and your reaction.

-I successfully accomplished Mod. 1.0 on my new R75 and
really would not have purchased the radio if I had not
known about the Modification thanks to you.
I have many years of soldering experience behind me so
I was confident about completeing the modification.
I remember my first days of soldering on CB radios and I must
admit it takes practice as you advised. This expensive ICOM
radio would not be a place to start learning your solder skills.

-Even if the modification had gone astray I would have been
totally to blame. I was a little concerned as I bent the lead up
on the IC hoping not to hear it snap!
Your instructions were detailed and extremely thorough.
I even contributed a safety concern which you
later included in your revised Mod.

-All that the future owners of the R75 can hope for is that
maybe ICOM will realize that the improvements such as yours
really benefit the end user and should be a standard feature
on the newer units. I understand that this radio has to meet
certain FCC requirements and this minor change could take
a while to be processed and implemented by ICOM.
Hopefully they will address the issue for existing and future
owners.

-If another commercial company offers to accomplish your
modification I hope you are reimbursed accordingly. A lot
of time and research was done on your part and you should
at least benefit from your efforts. Maybe the company that
offers the AM SYNC mod can also include the switchable
1.6MHz and below attenuater mod. as well.

Thanks for all your work and I still look forward to
participating here in the R75 e-group.

Eddie Bryant

hi jem, i'm glad you are feeling better about the radio R75. i hear those kenwood
r5000's are superior for am dxing. icom really concentrates on utes ,rtty, and cw etc.
their strongpoint has never been am or world band, though wb isn't bad.when i had
a nrd535d still the am synch was a joke. even on that great radio and am was okay
but not that great. i think if you max out the r75 w/filters etc....you have a radio as good as any
up to 2,000$. that nrd545 is not that great-the dsp in it doesn't work as well as it was supposed to. any way i hope you feel better now. i will have the am synch/agc mod done by Kiwa
electronics. merry christmas and let's buy that ten tec sw for 4,000$.

Hi Rado!
I don't agree with which you remove the mod of the list.
Because you are throwing this way to the floor your work !.
You should think of the new users of the r75 that don't still know your work.
I didn't still carry out the mod ...but I will make it, I feel sure because I have many years of soldering experience, (in my school we made one replies of the tower Eiffel in wire copper soldier.. like practices), and recently I bought the rx and had never known about your mod!
Your in the mod. you notice that they make it those that are qualified, so don't have responsibility for it.
Thank you for your great work.

Rado:

You provided some excellent information to the R75 community, and I applaud your efforts.

I completely disagree with your reaction to people that are having problems making the modifications. I think that removing the files is unnecessary. All that is needed is to add a strong disclaimer in the mod files.

Yes, the modifications are difficult to make. It requires some experience soldering fine traces and so forth. Not everyone has those skills. However, some people on this group do have the technical skills to carry out the mods safely, and to deny everyone the information because some might not heed your advice is unfair.

I would like to see the modification instructions (with warnings added) restored to the file section. Remember, you are not responsible for what people do with the information you provide.

Thanks,

Keith

(p.s. If you don't repost them, could you email copies of the files to me? I havn't downloaded them yet.)

Eddie, Enrique and Keith - Thanks for your support!

At first I've developed the modifications to improve my own radio. I provide this information only because I want to help others. I don't expect any benefit but I also do not want damaged radios and unhappy people to hang on my consciousness.

I've added a warning message to the instructions. English is not my native language so it may not be frightening enough - advise me on this.

And again:

- READ THE INSTRUCTIONS 3 TIMES
- PRACTICE 10 TIMES
- ITERATE THE ABOVE TWO STEPS UNTIL YOU CAN DO IT WITH YOUR EYES CLOSED
- GO TO THE R75

Best regards,

Rado

ROTF. Works for me! Most of you may not be from the NYC area, but there used
to be a guy that sold stereos called Crazy Eddie. Kinda reminded me of that.

Hi Rado! (and everyone)
Rado I understand your concern and think it shows u care about
everyone here abouts.

I just want you to know that I feel i took on the job of modding the
radio with my eyes open, i knew it was a risk and hard. I had trouble
and nearly blew it, but all is great now.

But please understand that even if it had of gone BANG!!!!!!!!! and
never worked again, there is no way i would think u even slightly
responsible. There are heaps of warnings and u can see by looking in
that its no place for plumbers (sorry all u plumbers).

It was my risk i took it. I thank u very much for letting us all know
about it, i think u are are a true dXpert!

Thank u mad merry DXmas all

From: aunumero13@aol.com
Topic: 228 Message: 228

Hi R-75 users,

I've just received a R-75 and ran some tests with my TS-870S....
Here are the results on some LF frequencies :
(Ant. was ALA-100, 18m circ. loop from Wellbrook)

KHz. Station S on R-75 S on 870S
60.0 MSF Rugby S8 S8
75.0 HBG S9+ S9+
77.5 DCF S9+ S9+
291.0 "WS" NDB S0 S7
346.0 "CH" NDB S3 S8
603.0 "France Bleu" S9+ S9+
765.0 "Option Musique" S9 S9
Results are very similar below 300 and above 500 KHz but not in between.

Have some of you noticed this lack of sensibility around 300 > 500 KHz ?
I'm a bit disappointed as my main interest in NDB DX'ing....
How to put it right (except using the preamp that brings a high noise level) ?

Thanks for your help,
Pat (France)

Hi Pat-

I'm just curious if you've done the mod for AM sensitivity. Apparently there's a deliberate loss to help prevent overload in the MW ranges, and I don't know how far down this goes, but 300 might be a good guess. :)

Would be worth a look!

Ken

My R75 with the mw attenuator removed has good sensitivity also between 300 and 500 kHz. An NDB in Alert NT Canada was heard 3 days ago. Your sensitivity problem seems a little strange as there are no bandpassfilters especially for this band. Berhaps something wrong with the lowpassfilter?

Hi Pat,

Yes ... as Gert pointed out the insensitivity region seems strange. I'm not into LW but I can hear a lot of beacons between 300 and 400. Also Radio Russia at 273 kHz (? not sure about the exact freq.). My <1.6 MHz attenuator is still there (not shorted). Have you tried the other antenna input? Which one are you using?
There is no 3rd IF (450 kHz) "trap" filter I can see in the schematic (the reduced sensitivity seems like it's something like this).
My recent experimentation with JJY at 40 kHz (time signal in Japan) showed that Preamp 1 even reduces the sensitivity at such low frequencies. Probably due to the coupling transformers it uses. The inspiration for this experiment was a radio-controlled clock (uses JJY) I've bought several days ago.

Best regards,

Rado

Hi Rado and Gert,

Many thanks for your replies.

<< Have you tried the other antenna input? Which one are you using? >>
I'm using the 50 Ohms input.

It's amazing to see how the signal level can change within a few kilohertz....
The broadcast station on 273 KHz is very loud and as strong on R-75 as on the TS-870S (and as far as I can remember, as strong as it was with AOR-7030 too).
The S-meter shows a very similar value on both sets.

Then on 291 KHz, where a local NDB transmits, (less then 20 KHz up !!!) the value is completly different (S7 on the 870 and S0 on R-75). How can this happen ?
I listened carefully but did not notice any change and the background noise level though the beacon seems to be stronger on the Kenwwod.
Does this mean it is simply due to the S-meter calibration that is unaccurate up to 280KHz ? Tomorrow I will probably make some measurements with a SSG.
So wait and see.

Kind regards,
Pat.

233. Optional filters

Topic: 233 Message: 233

Hi everyone!
I just uploaded a MS-Excel file into the info folder of the files section.

Its a table of the filters ICOM offer as options for the R-75 and how they can be employed and what they give you.

What I have not taken into account is such things as shape factor and filter quality, nor the effect of using various combinations (using 2.8 then 2.4 compared to 2.4 then 2.8) as i dont have any experience or info on this.

Also some people may have different ideas on pairings, and Im not sure about the synch mode 455khz restriction.

I would really appreciate if some of you who know how the filters perform and work together could check this out and give me feedback, as i think if we can polish this chart up it would be a good guide for anyone planning to buy filters.

Well if my chart is right I think i will get FL103 & FL222 or FL52A.

Hi Pat,

I don't have SSG but today I made a quick and dirty SG from a single-conversion analog portable. I modded it a little so that the LO could go down to 300 kHz. Using the S-meter on the R75 I found no "singularity" points in the sensitivity from 300 kHz up to 1 MHz. There is a slow trend of increasing of the sensitivity as the freq. goes up but this could be an artifact from my "quick-n-dirty" setup. I checked the S-meter reading every 5 kHz. I used ANT2 input.

Waiting to see your SSG results.

Best regards,

Rado

Hi again Pat,

The ANF also works in AM/S-AM modes. I have not checked if it could be enabled in CW but even if it could I think it will actually "notch" the CW itself. It is an audio DSP so it makes no difference AM/SSB/CW.

Best regards,

Rado

237. Speaking of filters

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-28 11:55:04 UTC
From: Radostin Danev
Topic: 237 Message: 237

Hi R75-ers,

Yesterday I changed the 15 kHz/450 filter (Murata CFWS450E) with a 4 kHz one (CFWS450IT). This is really THE FILTER. Now my filter settings for AM/S-AM are:

AM
9 MHz 450/5 kHz

Narrow - 15 kHz 3.3 kHz (FL-257)
Normal - 15 kHz 4.0 kHz (CFWS450IT)
Wide - 15 kHz 6.0 kHz

S-AM
9 MHz 450 kHz

Narrow - 2.4 kHz 4.0 kHz
Normal - 15 kHz 4.0 kHz
Wide - 15 kHz 6.0 kHz

This filter should have been placed by iCOM instead of the 6 kHz one. It makes a lot of difference - no more adjacent (5kHz) channel heterodynes and the audio quality (speech) is almost not impaired. The 6 kHz one is for strong stations in the clear. Maybe I'll upload audio sample soon.

The modification itself is much more difficult (at least it was for me - I don't have a lot of tools) than the AGC/Synch. mod. De-soldering the old filter was a pain in the a--. My iron is only 30W so it was a little on the weak side - 3 pins of the filter are soldered to massive ground. The board is multilayer so the holes were full of solder from one side to the other - very difficult to remove it. Any tips for such situations? It took me about 45 minutes to de-solder the old filter. Soldering the new one was a breeze.

Anyway - I'm very happy with this upgrade. Makes a lot of difference on S-AM.

Best regards,

Rado

P.S. I have one more CFWS450IT - if someone wants to try his "soldering muscles" I'll be glad to send it to him. The first to request gets it.

> It only functions in SSB and I'd like to use it in CW....

I just tried to enable the ANF in CW mode and my R75 just made a low pitched beep to say it didn't want to do it, so no you can't use ANF in CW mode at least not on an unmodified R75.

I did try enabling ANF whilst listening to some morse in LSB mode and it does a very good job eliminating the morse apart from some slight clicks as each tone starts. This is exactly what I expected it to do though, so I'm not sure what you hoped to achieve? If you were hoping to use the ANF to eliminate one morse signal to make listening to another easier then I'm afraid you won't be able to do that as the ANF is automagic rather than tuneable by the user.

If you're trying to peak a particular morse signal and find that the R75's filters plus pass-band-tuning won't do the job well enough then you could try an external DSP. My favourite is a software one (Windows only I think) called ChromaSOUND.

Cheers,

Mark.

240. How to Defeat the 1.6MHz attenuation

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-28 17:38:23 UTC
From: aunumero13@aol.com
Topic: 240 Message: 240

Hi Don, Gert, Rado and the other ones !

First of all, I would say "sorry for my very poor english" !

This afternoon I visited a friend who has a SSG and we made some measurements.
Actually, we wanted to removed the attenuator (for freq. below 1.6 MHz) and
see what happens because my main interest is NDB DX'ing.

R-75 specs show sensitivity abt 2.0µV below 1.6 MHz and abt 0.2 µV above.

Gert wrote : <<Just bridge the small gap!. It is very easy to check.
Just use a screwdriver to make a connection. >>
We did this but found a very small difference !!! 4 dB only on the
generator....
Gert : could you tell me what you had "before" and "after" the mod ??
(i.e S5 before, S9 after on xyz frequency)
Maybe we did not make a "clean" connection ? there was no difference on the
S-meter when we bridged the small gap.

I'd like to see the schematic just to be sure we put the screwdriver at the
right place !!!
Please confirm we have to remove the upper lid to reach the CP
I can't believe it makes such a poor improvement.... I'm very disappointed.
the CP looked like a circle (orange) divided in 2, close the the rear panel.

<< This modification makes a big difference in weak MW. >>
Lucky guy !!!!

Infos are most welcome...

Pat.

241. How to Defeat the 1.6MHz attenuation

From: aunumero13@aol.com
Topic: 240 Message: 241

Hi all,

An important thing I forgot to ask in my second mail (concerning the attenuator) :

when the attenuator is not removed and if you listen to a "clean" frequency, is there a big difference on the noise level on 1500 KHz for example (attenuator "on") and 2200 KHz where the attenuator is supposed to be disabled ?

Scanning quickly the band here, I did not notice any difference in the noise level around 1600-1800 KHz. I suppose it should....

BTW, where does the attenuator start "working ? 1.6 or 1.8 MHz ?

Using the TS-870S we immediatly know that the attenuator is enabled : on 489.9 KHz the noise level is quite strong .... on 490.1 it is much weaker... I did not notice such a difference on the R-75 !! maybe I did not tune to the right frequency but it seems a bit strange...

I hope i'm not too boring with this, but I'd like to improve sensibility on LF/VLF.

Pat..

Hello Rado,

I had some prior experience in desoldering RF transistors on massive
heatsinks and also components on multilayer circuit boards. The
Weller soldering station is the way to go. It is regulated and when it
starts to see the heatsink effect from the large mass (multilayer circuit
board) it will regulate the tip temperature thereby putting out a better
regulated tip temperature. My preference is using solder braid to wick
the solder. I never really liked the bulb type solder sucker or the
catapult type solder sucker either. I also had good experience with the
pneumatic air type desoldering iron. Although ,this requires a source
of air to power the solder removal operation.

If you were using a plain pencil tip soldering iron I can see why your
message contained the expletive "pain in the a--"! : ')

I think if you could apply heat to all three solder joints at once and
remove it you would be a lot better off. Otherwise if you did not care
to salvage your old filter you could just cut it up with a pair of cutters
and since you would be removing the heat absorbing mass of the filter
it would probably just come right out a lot faster with less chance of
pulling out the eyelet.

It is a hard call ,but the last thing you want to have to do is rewire the
internal workings of a damaged PC board.

By the way , I uploaded an Image to the FILES SECTION of this
egroup that shows the inside of my R75 and the two solder pads that
can be jumpered to provide the additional gain below 1.6MHz. On my
radio this is typically a 1/2 to 1 S-Unit. I am not too sure this is all
that
beneficial but I did place a SPST switch in my R75 so I can enable and
disable it.

Hi Enrique and others,

The filter goes to Ron - he was first.
I got 2 filters from Murata as samples after I wrote an e-mail to their international department asking where can I get such a small quantity in Japan. Before that I tried shops and distributors but to no avail. One week after my inquiry I received a package with the filters and product catalogs. In USA maybe it will be possible to find it from a distributor or again as a sample from Murata.

Another option is to install a Kiwa premium 450 kHz module - it has much better shape factor and ultimate rejection see it at:

http://www.kiwa.com/PFM450.html

Best regards,

Rado

246. Re: How to Defeat the 1.6MHz attenuation

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-29 07:49:16 UTC
From: Gert Nilsson
Topic: 240 Message: 246

I did not make any measurements at all. I just listened to the atmosferic noise on medium wave and had a pronounced increase in volume, perhaps in the range of 10 dB. I do not use the S-meter, because this is a digital one with 5 dB steps I think! I also think it underreads a lot on weak signals.

When comparing different receivers the S-meter is not a suitable tool at all. Compare actual readability on very weak signals.

247. Front-end preselection/loss simulations

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-29 12:10:33 UTC
From: Radostin Danev
Topic: 247 Message: 247

Hi R75-ers,

I simulated the passive part of the R75's front-end (before the first mixer). The results are in the file "R75 front-end preselection simulations.pdf" ... Files/Information folder. The effect of the <1.6 MHz attenuator is just about 2 - 3 dB. If the attenuator is removed (R172 - 18 Ohms shorted) there is still loss coming form the resistors R171 & R173 (both 270 Ohms). The global attenuator gives solid 20 dB (not shown in the figures).

Best regards,

Rado

248. Re: S-meters, different readings

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-30 00:25:19 UTC
From: jjga@usa.net
Topic: 240 Message: 248

I absolutely agree with Gert. We have to remember that any S-meter shows only a relative measure (Einstein!) of the strength of any given signal. Different sets --even from the same manufacturer-- exhibit sometimes surprisingly different readings when tuned to the same frequency with the same antenna (so nobody tells me!), when in fact, the signal/station legibility is identical or very similar on both units. My R75's meter underscores many soft signals I can nevertheless perfectly hear. There is almost NO READING, zero, but the station is 'receivable', so the rig is imperfect on that regard, it should mark something, S1 at least. I have noticed that happening several times since I got the Rx earlier this month, compared to my Drake R8A's S1 or S2 for, of course and again, the same signal, with the very same antenna. Close your eyes, use your ears, that's the ultimate S-meter! Well, there is no need to exaggerate!

From: Robert Fleck
Topic: 249 Message: 249

Hi,

My primary interest is shortwave dx'ing so I recently installed a optional FL-257 filter to hopefully improve sensitivity. I currantly have my filter selection setup as follows for AM:

9mhz 455mhz
normal 15 - 3.3
narrow 2.4 - 2.4
wide 15 - 6

Can anyone suggest a better combination or recommend additional filters ?

Thanks

Bob

251. New poll for icomr75

Yahoo group: icomr75 (2000 — 2002)
Date: 2000-12-31 06:11:13 UTC
From: icomr75@egroups.com
Topic: 15 Message: 251

Enter your vote today! Check out the new poll for the icomr75
group:

Which accessories have you added to
your R-75 installation?

o DSP Unit
o External Speaker (ICOM)
o External Speaker (Other)
o FL-100 9MHz 500Hz
o FL-101 9MHz 250 Hz
o FL-103 9MHz 2.8 kHz
o FL-223 9MHz 1.9 kHz
o FL-232 9MHz 350 Hz
o FL-52A 455K 500 Hz
o FL-53A 455K 250 Hz
o FL-96 455K 2.8 kHz
o FL-222 455K 1.8 kHz
o FL-257 455K 3.3 kHz
o Voice Synthesizer
o High Stability Crystal Unit
o Computer Control Software (any)

To vote, please visit the following web page:

http://www.egroups.com/polls/icomr75

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the eGroups

Topic: 252 Message: 252

Since I'm also quite interested in replacing my R75's stock Murata 15kHz/455 (E) filter with a narrower version like the one Rado used on his (IT), I've been looking for more information on the topic, but I'm not too sure yet that the IT 450kHz filter has the right bandwidth I'm after.

Please visit the following URLs (you might have to 'copy' and 'paste' to your browser) when you have a chance and compare the two. Look mainly at the 'Area of Selectivity' and click on 'Frequency Characteristics' on the right panel to see the graphic. Is that IT filter 4kHz wide as stated in the group, or rather 7.5?! Unless...

Rado will surely offer his viewpoint and experience using it, comparing it to the 6 and, let's say, his 3.3 FL-257. If he says it 'sounds in-between' those two, everything should be fine I guess...as long as you know how to do the job, watch out! (Somebody who can will do it for me.)

CFWS450E:
http://www.murata.co.jp/Ceramy/owa/CATALOG.showcatalog?sHinnmTmp=CFWS450E&sLang=2&sNhnm=CFWLA450KEFA-B0&sHnTyp=OLD

CFWS450IT:

From: Ken
Topic: 252 Message: 254

Well, my poll regarding accessories has raised a few more questions :) so I hope nobody will mind if I ask here in the list.

Several people have indicated that they are using computer control software...

My question is WHAT PROGRAM? The Poll won't allow a "fill in the blank" question :)

My personal favorite is Smart Icom from Fineware, but I'm curious what others are using.

Ken

Topic: 252 Message: 257

Hi Jason,

I've just uploaded in the Information folder the whole filters catalog of Murata. Filename: "Murata_piezo_filters.pdf". There the information is more easy to interpret (the CFWS series are listed for the 455 kHz version but the characteristics are the same for the 450). The 6kHz filter in R75 is CFWS450HT.

> Rado will surely offer his viewpoint and experience using it,
> comparing it to the 6 and, let's say, his 3.3 FL-257. If he says
> it 'sounds in-between' those two, everything should be fine I
> guess...as long as you know how to do the job, watch out! (Somebody
> who can will do it for me.)
>

The IT is noticeably narrower than the HT but it is wider than the FL-257 (by ear observations). I use constantly S-AM (can't stand AM since the fix of the S-AM) so my FL-257 does not get a lot of use. For S-AM and AM the IT is much better then the HT (removes the 5 kHz heterodynes and makes the speech much easier to understand). From my ears the three filters HT, IT and FL-257 form a very nice sequence (equally-spaced). I'll upload an audio sample soon which will include each of the above filters.
Still I think that something like the KIWA 4kHz premium module will give much better results than the IT (but I got the IT free).

Best regards,

Rado

I called Kiwa this afternoon and talked to Craig Siegenthaler regarding replacing that stock 450/15kHz filter. He doesn't feel their 450 module is the best way to go (?!). His opinion, not mine.

He recommends an 'exact match' [size-wise] to the CFWS450E, a less expensive ($40.00 + $2.00 shipping in the U.S.) LFH2SKW (450/4kHz bw [3.8/3.9 kHz @ -6 dB BW]). It's the same they use to upgrade the Sangean ATS-909 (R. Shack DX-398), etc. I'm going to go for it hoping it fits well. The specs are, on paper at least, exactly what I was looking for.

http://www.kiwa.com/ATS909.html

509.453.5492
800.398.1146 (orders only)
kiwa@...

Craig probably won't set an installation price until he does my radio and see how it goes, how difficult it is... I'm hopeful he has better soldering irons than Rado! :-) :-)

Now seriously, we don't know how well it'll work yet. You might want to wait until my 'guinea-pig' R75 returns and I test the enhancements and let you know. The Icom will leave for Yakima, WA tomorrow Thursday 01/04, along with my Drake SW-2 which is going for the 'Performance Upgrade'...another narrower AM filter there.

I will report to the e-Group at the end of January, when all the work is finished...if the radio survives all the surgery!

Well, guys, if you can't wait and you happen to call or write to Kiwa before I can report on the mods, don't forget to mention "Jason sent us", O.K. I might even get a break in price! ;-)

Rado, for your information, I'm sending along to Kiwa copies of your v.1.1 mods, the simple MW attenuation removal, some schematics, etc. to make things easier for Craig. He is one of the very best at these things but he doesn't have the documentation.

Thanks again, R. I really trust your ears and your comments below...but there was this other chance that suddenly came available, and I decided to try it and see what happens so others can also perhaps benefit from it. Keep your fingers crossed that it'll work as desired/expected. It will be nice to have another BW in between 6 & 3.3 (FL-257)!

Cheers and Happy New Year-Century-Millenium to all.

Hi, I have just purchased the IC-R75 with DSP and I'm also going to buy a Wellbrook ALA 1530 active loop antenna. The Wellbrook antenna recommends RG-58C coax as the cable to use but I always thought that RG-213 was the best cable due to the low signal loss.

I would be grateful for any advice on which cable I should buy.

Thanks
Ross

On shortwave and short cables, the RG 58 will be quite enough!

As Gert said, RG58 should be fine for HF RX unless you have *very* long
cable runs. I feed my ALA1530 with about 40 feet of RG58 and it performs
very well.

Cheers,

Mark.

Hi Ross,

Check the comparison table at:

http://www.therfc.com/attenrat.htm

Per 100 ft (~30 m) at 10 MHz RG-58C will give -1.4 dB; RG-213 will
give -0.55 dB.
These losses are negligible ... especially with active antenna.
The price ratio is about 1:2 ... the loss ratio about 2.5:1. So RG-213 gives
sort of more bang for the buck. Don't know about the long term stability of
both (weather etc.).
If you are also in the VHF/UHF monitoring the 213 is the better choice.

Best regards,

Rado

If it's like the CFW455IT, I suspect it has a nominal bandwidth of 5.5
kHz.

266. Is Sync MOD working?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-07 08:17:27 UTC
From: khgrant@ix.netcom.com
Topic: 266 Message: 266

Rado (or others):

I made the mods per ver 1.1 tonight (thank you Rado for the directions).
I'm puzzled by the results I'm getting. The improvement in the AGC behavior is dramatic. It seems to ride right through the fades quite well. The wierd part is that I can't detect any difference at all between the AM and AM-Sync audio signal. I used the same component values as described and verified my connections. I'm wondering if the huge increase in the AGC delay is masking the synch improvements? The audio howls briefly when synch is engaged and then settles right down. Moving off frequency a bit, it will synch back up just fine until I exceed its capture range, which I expect. So obviously it functions! The issue is that while sitting on a station with some fades, having synch on makes no discernable difference in the audio quality (keeping in mind that the improvements brought about by the AGC mod for AM are quite dramatic) from normal AM.
I'm wondering if just performing the AGC mod would be sufficient? Maybe I'll try disconnecting it to see. When I get around to it, I'll let you all know.

Anyone else notice this?

Thx,
Keith

267. Re: [icomr75] Is Sync MOD working?

I haven't made any modifications at all to my R75, but despite the fact that S-AM isn't supposed to work, I can still get howls by moving off frequency with S-AM mode selected, and can hear a pop as the VFO locks back onto the correct frequency; the howls are cut off abruptly at that point. Makes me wonder if the radio may have been modified by technicians at the store where I purchased it (new, but a demo). I notice no other difference in performance between AM and S-AM, however.

Hi Keith,
Be sure you're tuned to a station with SELECTIVE fading.
You should hear a noticeable improvement in s-am mode, especially if
the distorsion is severe (I have two nice audioclips on this if
anyone is interested.
I'm not sure this would be important but I've selected SA in the
setup (s-am always on).
/Johan L, Sweden.

270. Filters: 3.3 or 2.8kHz?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-07 22:45:43 UTC
From: khgrant@ix.netcom.com
Topic: 270 Message: 270

Okay, another filter question:

I want to get 2 filters for my R75. My listening interests are AM, AM-S, and SSB. I havn't done much RTTY, so that is not a high priority for me.

After looking at J Cullen's filter spreadsheet (thanks for the resource!), and looking at other peoples comments, my plan is as follows:

I want a narrower 9 MHz filter for SSB (FL223 1.9kHz). I also want a wider 455 kHz filter than the stock 2.4kHz for AM and SSB listening.

So now the question - which one would be a better choice: the 3.3 or 2.8 kHz filters? By my way of thinking, the 2.8 seems too close in BW to the default 2.4 kHz filter. I'm wondering if I would be better off with the 3.3. Seems like it would make a good filter for the AM medium and SSB wide positions.

Does anyone have direct experience with this choice? I would appreciate any feedback you have.

Keith

(I just made the Synch/AGC mods and am enjoying playing with the radio)

Hi Keith,

As Johan already mentioned the synch. improves stations with selective fading. Find a station which has distortion on the audio during the fades in AM mode (selective fading) then switch to S-AM. The synch. also improves the audio with the narrow filters even if there is no selective fading (phase delays in the passband I think). Set the narrow mode for both AM and S-AM as: 2.4kHz/9 6kHz/450. Now find a relatively weak station and switch between AM and S-AM ... there should be a difference.

A tip: If you are tuning around in S-AM mode turn on the ANF - this almost completely eliminates the whistles leaving only some clicks (very fast auto-notch!). When you are locked on a station turn off the ANF for better audio.

About the filters to buy - I have the 3.3 kHz/455 filter. This is a nice choice for both AM (not selectable in S-AM) and SSB.

Best regards,

Rado

Hi Johan,

Could you upload the audio clips in the "Audio" folder in the "Files"
section of the group?

The SA setting in the setup should do nothing after mod Ver.1.1.

Best regards,

Rado

The synch mod is still not working! There is no audible difference between AM and S-AM regardless of the signal strength or fading. I've been playing with it for several days now and am running out of ideas.

As I noted before, the modification did improve the AGC behavior, but S-AM does not produce any noticable change regardless of the fading.

I've tried 'SA' mode on and off with no change. Setting the filter bandwidths to narrow for both AM and S-AM results in no audible difference with S-AM! When I switch to S-AM mode, I hear a brief whistle which leads me to believe that it really is switching modes. Whistling also occurs when I tune off frequency a bit, to the synchronous detector appears to operate.

I have checked and double checked my wiring (I'm an electrical engineer among other things) and everything matches the schematic. I was pretty careful about static and soldering so I don't think I damaged anything.

Anyone have ideas? About the only thing left to try is to replace (or measure) the caps. The 12K resistor is ok.

Hi Keith,

Not working in sense that it does not remove the selective fading distortion? Or you are listening to a station which does not suffer from selective fading? Do you know what selective fading sounds like?
From your description I think that everything is OK with the mod. If you hear a whistle when de-tuning this means that the synch. is working.
Check the audio sample in the Files/Audio folder of the group:

http://www.egroups.com/files/icomr75/Audio/

The R75 is in the left channel. Also read the description text file for the audio sample.

Good luck!

Rado

i think what you should keep in mind is which combination of filters gives you which extra bandwidths in synch mode.... I dont have access to the table right now but you will find there are limitations on am-s filters. If you have already thought of this i apologise for the interruption.

I think 1.9 +2.8 seems a good combination.

Rado:

Yes, I do know what selective fading sounds like. I have tried it on many weak stations with no difference.

I agree that the whistling indicates that it is basically working, but I can't explain why it does not improve the audio perceptibly.

I tried the earlier suggestion to use narrow filters for both AM and S-AM and swiched between them. Absolutely no difference! I've listened to the audio file and don't get the same results.

Is it possible that the cap(s) I installed are either mis-labeled or defective? Might that lead to the symptoms?

One thing I don't remember: did S-AM whistle when de-tuning before the mod?

Any help would be appreciated.

Yes, the S-AM has the whistle before modification. In fact the S-AM functions, but it looses the lock and there is a problem with the AGC. Are you sure that the lifted pin of the IC is free from the tinned area below? If not, your S-AM functions as before.

This is strange. There should be some difference.

> Is it possible that the cap(s) I installed are either mis-labeled or
> defective? Might that lead to the symptoms?

I don't think that mis-labeled is a possibility. Defective is more likely. Check the polarity and as Gert mentioned - connect a DC voltmeter between the wire from pin 23 (positive leg of C2 in the instructions) and ground (negative leg of C2). The voltage should be above 0.5 V. When locked on a station it should go up (as I remember above 2.0 V). Check that the ground connection is good.

> One thing I don't remember: did S-AM whistle when de-tuning before
> the mod?

If you are centered on a station and S-AM is locked then:

1) before the mod: there is no audible whistle when de-tuning in 1 kHz steps until you go more than 3 kHz from the carrier - then there is a constant whistle (out of lock range).

2) after the mod: there is about 1 sec whistle when de-tuning in 1 kHz steps before the PLL is re-locked. When you go more than 3 kHz from the carrier the whistle is constant (out of lock range).

If pin 23 is still grounded then the behavior should be like in case 1). If pin 23 is "floating" (bad cap or connections) then the behavior will be more like 2) but there will be some strange things (have not tried it). Maybe your pin 23 is floating. If the connections are OK then replace the cap with new one.

Good luck!

Rado

280. Test of the rx

Topic: 266 Message: 281

Rado:

Ok, I've tried several things now.

I re-verified my wiring. Pin 23 is not shorted to ground.

I swapped out the 100uf cap; no change.

With S-AM enabled, I can tune -3.1 - +4.0kHz before losing synch lock.

Monitoring the DC voltage on pin 23 produces odd results. When S-AM is enabled, it measures 0.772V. Turning synch off usually results in 0.761V but sometimes the voltage jumps to 1 - 2 V. Nothing audibly unusual occurs when this happens. Enabling and disabling synch again usually shifts it back to 0.761. Have you ever noticed different DC voltages when synch is disabled?

How dramatic a difference do you hear on fading signals? I have a Sony 2010 which has a great synch. When I switch the synch on the change in the audio signal is rather dramatic. I'm trying to downgrade my expectations, but if there are differences in the signal, I'm having trouble resolving them.

As always, you help is greatly appreciated.

283. New audio samples uploaded

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-11 02:52:28 UTC
From: Radostin Danev
Topic: 283 Message: 283

Hi R75-ers,

Check the new audio samples in the Files/Audio folder of the group.

Johan has uploaded two S-AM samples (in RealAudio).

I uploaded another two samples (this time the files are small - I learned how to make nice MP3s :-)):

1) 30s AM 30s SAM.mp3

Till now we have been discussing the improvement S-AM gives to selective fading stations. There is another advantage however. With weak stations close to the noise floor and narrow filters S-AM provides much better S/N ratio. Even if there is no selective fading (just usual one) when the station fades close to the noise floor AM detection distorts the audio. S-AM provides much cleaner signal.

2) 20s 6k SAM 20s 4k SAM 20s 3_3k AM.mp3

This is an example of the filter upgrade (change 15kHz/455 filter with 4kHz one). I cannot use the 3.3kHz (FL-257) in S-AM mode so the last 20s are in AM mode.

Best regards,

Rado

284. Some thoughts on the IF freqs.

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-11 03:04:42 UTC
From: Radostin Danev
Topic: 284 Message: 284

Hi (again) R75-ers,

About the implementation of AM and S-AM IC. Icom could have implemented it at 455kHz IF. The IC spec shows that it can be used on a wide range of IF frequencies. Now I wonder why Icom choose to use separate (450kHz) IF for AM and S-AM. Two possibilities I can think of:

1) The engineer simply read the datasheet of the IC and choose the IF used in the examples there.

2) It was difficult to find 3.64 MHz ceramic oscillator for the PLL (they use 3.60 MHz = 450 x 8)

Think of the advantages of a single IF (455kHz) - easy to find filters (450kHz ones are rare); all the filters could be used in all modes (SSB, AM, S-AM) etc.

This makes me think that Icom designed this receiver in sort of a hurry.

Well, I'm still very happy with my R75 - love it.

Best regards,

Rado

In AM mode the voltage on pin 23 is sort of unpredictable - the PLL is
turned off. You should only check it when in S-AM.
How long does it take for the synch. to lock after you switch to S-AM?

> How dramatic a difference do you hear on fading signals? I have a
> Sony 2010 which has a great synch. When I switch the synch on the
> change in the audio signal is rather dramatic. I'm trying to

Now one can say that the SONYs have poor AM. That's why such a big
difference between AM and synch. R75 uses quasi-synchronous detector for AM.
Theoretically if there is a strong carrier there should be almost no
noticeable difference between AM and S-AM. With selective fading and/or weak
stations S-AM should provide much better audio.

Here is the best way to check if your S-AM is working as it should. Take
your Sony 2010 and your R75. Tune them both to a strong station suffering
selective fading. Set both radios to AM mode and wide filters (6kHz). Place
one receiver on your right side the other on your left. Adjust the volumes
so that you hear both radios equal. Confirm that when there is carrier fade
you hear the distortion on both radios (AM mode both). Now switch R75 to
S-AM. You should now hear the carrier fade distortions only on the Sony.
Switch the Sony to synch. mode. Compare the performance of both synchs. Let
us know about the results.

Best regards,

Rado

Howdy
Gerry THANK YOU!!!!
I been a member of e-groups for a while but just found this group yesterday. I've had my R-75 a while. I was going to post after I read them all but I am stunned, pure stunned with your answer. It took reading over 129 messages to get to one that made sense. I learned more from this one post than all the rest. This aint my first rodeo, been dx swl on and off since I was on the DMZ in Korea during the mid 70's and I have owned a few shortwaves since then- analog and digital but my forte ain't in electronics and I know it. Antennae and knob twiddling are about it, but u know what? That's all I have ever needed all these years. U know its nice to know about electron flow, filament composition, power generation, charged atoms and all that but the light still works when people who don't know that throw the switch.
Joe
in North Texas

user and abuser of the following radios
a couple analog, a DAK, a DX-440, a DX 394 (still a workhorse in my gunsmithing- reloading shop- nobody ever told it that it got bad reviews) an ats 909 (which was sent and is on active duty to Bosnia), a (head hung low)grundig yb 400 which is the most disappointing radio I have ever owned (My aor 8200 and 1500 work better on swl) a DX-398- yes, yes, I know, I know but I loaned out my 909 as I said and I live real close to the REAL radio shack outlet in Ft Worth Tx and the price more than made up for the loss of 909 vs DX-398 label on the case, and the IC R-75 and I studied long and hard about that or the Drake and I will flat out say it- money mattered!!!

Rado (and anyone else):

The Sync mod Works! I'm embarrased to say that it has been working all along. I was just not listening for the right thing! Thanks for your recording, it helped me figure it out. I had to re-listen to that recording several times before I recognized the difference between sync off and sync on. Must be my aging ears!

I then did as you suggested and compared the R75 to my 2010. I haven't played with the 2010 since I got the R75, and forgot the exact effects of the synch detector.

I now have to agree with others that the sync modification is definitely worthwhile!
The sync is still not as good as that of the Sony 2010, but it definitely helps. I wish there was a way to make it sideband selectable.

Well, my hat is off to you for coming up with the modification and for all of your help.

Thanks,
Keith

288. General comments about this site and the R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-14 16:08:36 UTC
From: DANNY BLACKBURN
Topic: 288 Message: 288

I am pleased to see this e-group, after stumbling around looking for it in all the wrong places! I am the owner of my second R75 receiver in about a year, having been forced by financial emergency to sell my first one back in August.

I am a little gun-shy about performing the sync-a.m. modification which seems to be so popular with the group, not for any technical reason (I earned my living as a service technician for years), but more for the fact I do not regard synchronous AM as a major feature. In fact, I have owned at least one receiver which had a SUPERB sync detector, far better than most available nowadays, but very seldom used it, unless I was recording a catch onto cassette tape.

I also responded to the polls, but I have a complaint to register: I was given only two choices to respond to in the "usage" poll. I may be the "odd sock" here, but I cannot be alone in using my R75 for amateur and SSB communications, at which the R75 so outstandingly performs!

Perhaps this is why I do not give much merit to synchronous-am performance, or it may be that I am from the "old school" receiver era---not boat anchors, but earlier solid-state technology---having been bitten by the SWL bug as a kid in 1967. For years, I tuned a good many receivers in search of some fine SWL/DX catches, including one very memorable Radio Uganda broadcast during Idi Amin's reign in the late 1970's on my first "serious" receiver, a Realistic DX-160. I grew up valuing a somewhat different set of criteria in my quest for improved receiver performance. Sync-am was not among them.

I am presently using my R75 with a Drake MS-8 external speaker---a leftover from my old Drake receiver mainstay days, when an SW2 formed the heart of my radio setup---and not only does the MS8 give me what I want with my R75's audio, it also looks VERY sharp next to my Icom with the tilt bail extended. I tried several different speakers with my R75, but the Drake has worked the best for me.

I primarily use SSB to tune AM signals, I find this technique to have served me well over the past 24 years, and now especially so with all the neat features available on the R75. I have equipped my R75 with FL-257 and FL-223 I-F filters, which gives me improved performance over my first R75. I also added the UT-102 voice synthesizer unit, primarily for "stamping" my recordings of QSO's and programs. It sure beats writing them in a logbook, and I can easily zip through a cassette tape any time after recording, to locate a particular catch.

I also enjoy the DSP module, I am still waiting for mine from Icom (free with purchase), but I am familiar with it from my first R75. Between the UT-106 DSP, the receiver's twin PBT controls and a good set of optional installed filters, I get great results in all modes without really needing sync-am. I do have a point to make further about the S-AM feature on the receiver.

I have found the synchronous AM to work better (when I do use it) if I first use the RF gain to "bury"
the signal until it just barely breaks the peak at the right end of the "S" meter bar graph

display. Of course, I must adjust the volume accordingly to compensate for the diminished audio, but this is a very minor inconvenience. I then engage the S-AM and there really IS a noticeable difference, when compared to just using S-AM on an "unburied" signal. I could only guess that the "factory" synch circuit is unable to handle signals on which the receiver's AGC was heavily engaged? Only when the S-AM indicator display is blinking, does the synch detector seem to be working. By using the RF gain in this fashion, I have noted that the S-AM actually works pretty fair, at least for my purposes. Perhaps someone else could try this, it may be a cheap-n-easy solution to modifying the unit?

In addition to the Drake speaker and the filters, I use my R75 with a dedicated cassette recorder, controlled from the R75's record remote option. My R75 is connected to a central 13.8-VDC power supply bus, from which all the equipment on my bench is powered. This bus is fed by a 55-amp DC power supply, which is heavy enough to handle my R75, scanner receivers, lighted accessories and my amateur radio transceivers.

My antenna array includes a Winegard multi-element scanner dipole, a triband amateur vertical and an Alpha Delta DX-SWL sloper for my Icom and my amateur gear, all anchored to a 38-foot tower. I also have Industrial Communications Engineering (ICE) lightning/surge protectors on my main coaxial cable feeds, and the scanner antenna if protected by a similar but smaller grounding device. These are all mounted to a three-rod grounding network and bolted to a grounding bus plate atop one of the three rods near the base of my tower.

My other equipment includes a Uniden BC-895XLT scanner receiver (Air/Search/Commercial), Realistic PRO-2050 scanning receiver (Trunk monitor/Public Safety), a Grove tunable notch filter and various antenna switches, meters, etc.

Thank you for reading my post, I hope to get a great deal more from my hobby now that I've found this site!
I will agree that the S-AM function on the R75 leaves much to be desired

> Sort of a P.S. to this, I feel that the R75 is a much better value

than the Drake R-8B, at least when comparing new equipment prices. I have not seen the R-8B priced lower than about $1100, but at under $600, the R75 blows it away in features and coverage. Even considering the cost of the filters, DSP and voice-synth modules, I feel the receiver still makes a better buy at around $1000 total cost, than spending the extra $100-300 on an R-8B, which I consider to be a great receiver in its own right. Only Drake's outstanding synchronous-AM feature and vastly-larger memory storage, separates the R-8B from the Icom. Icom's 50-MHz band coverage and superior construction easily offset this though, at least in my case.

Thanks!

RG-213/U cable in such short runs as yours, would be more difficult to work with. RG-213 is best for external uses, particularly where the cable will be buried or in direct-earth contact, due to its superior jacketing and rot-resistance. If you really want to improve over RG-58, I recommend what is called "RG-8 Mini" cable (RG8/X)---it is only slightly larger, is very easy to handle and work with, and is much less costly than 213 cable. I use it on my Alpha Delta SWL antenna, as well as my bench "jumper" and patch cables to all my tuners, switches and meters. Nice stuff! I got mine from Universal Radio in Reynoldsburg, OH. It has a slick, flexible silver-gray jacket and a very thick shield mesh.

I recommend the FL-223 in the second I-F, and the FL-257 for the third I-F. I am using these choices right now, and I have experienced the difference in performance over my first set of filters. My first set used an FL-222 which left no decent AM filter available for 9Mhz, and that mistake was a costly one, in that I had to sell both my old filters at a great loss, then buy two new ones of the "right" kind.

The real problem with the AM filter choices, is that the R75 already has 2.4-KHz filters in both 9MHz and 455KHz positions. This means that they are both too narrow for most AM work, and the stock 6-Khz filter is not sharp enough for crowded SW bands.

The choice is therefore made pretty easy, really! Since the ONLY plug-in optional filter available for AM is in the 455-KHz I-F stage, which is the FL-257 with 3.3-KHz bandwidth, this is the way to go. For narrow SSB, use the FL-223 in the 9MHz stage. It sharpens-up the selectivity nicely for amateur/utility SSB work.

My filter selections are:

MODE 9MHz 455KHz

AM-Wide 15 6
AM-Normal 15 3.3
AM-Narrow 2.4 2.4

SSB-Wide 15 3.3
SSB-Normal 2.4 2.4
SSB-Narrow 1.9 2.4

Hope this helps!

293. R75 "EXP" menu question?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-15 13:49:16 UTC
From: Danny Blackburn
Topic: 293 Message: 293

In the R75's filter-settings menu, there is a tab for "EXP on/off". I cannot seem to make this function change ANYTHING! At first, I assumed it was relevant to the addition of optional filters, but that is not the case, as the optional filters are assimilated through the use of the oP1 and oP2 tabs. The manual does little to provide an explanation for the "expanded" function. Seems to be a useless or at least, redundant menu setting. Can anyone in the group provide me with a clue about this feature?

294. Re: R75 "EXP" menu question?

Yahoo group: icomr75 (2000 — 2002)

Danny:

As I recall (I'm not at home) setting Exp On enables more filter choices for the selected function. I think it might be the Narrow setting, but I dont remember exactly.

Try this: set Exp Off, and scroll through the filter choices for the mode you selected. Turn Exp On and repeat the scroll. I think you will find that the list is longer.

Keith

From: Joe M
Topic: 295 Message: 295

Howdy yall
Just finished reading all 294 post in the
last couple of days so now I know who to buy
used equipment from and who not to :)
If u are like me and can't tell your radios
front end from your back end and all this
filter stuff is way over our head may I suggest
http://www.kiwa.com/kiwapub.html KIWA's
"Tips for Improving Receiver Performance"
followed by
http://www.kiwa.com/kiwa455.html
If anyone else has a site for BRIEF
explanations please list them.
Remember all that NECESSARY to operate a
short-wave is a power source and a piece
of wire- the rest sure does make it NICER to
operate one.
lol
thanks
Joe

296. "Rado"-mod Modification

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-16 00:24:47 UTC
From: Danny Blackburn
Topic: 296 Message: 296

After reading everything posted about the sync modifications, I decided after all, to give it a try. I approached the task of making the necessary additions to the circuit, with a view toward compromise of the recommendations by Rado, and based on my usual reservations about tampering with otherwise well-engineered equipment.

Instead of installing a 47uF cap between IC pin 23 and ground, I elected to use a 33uF one instead. I have found it quite satisfactory, perhaps just a bit faster to lock than the 47uF. The decay-time of the 47uF cap is of course, slower and would retain lock somewhat longer, but I reasoned that if a signal faded long enough for the 33uF capacitor to release the sync-lock, it would pay me dividends to have the sync re-lock more quickly.

I also compromised somewhat with the capacitor value used on pin #4. Assuming that a 470uF capacitor was only borderline-sufficient, yet not really wanting to more than double it to 1000uF, I chose a 660uF value to perform the task of slowing the IC's hyperactive AGC. Again, the results are completely satisfactory for me.

A previous post of mine to this site, detailed my observations of my unmodified receiver, and the use of the RF gain to "bury" a signal. What I interpreted as an action by the sync circuit, was apparently only a characteristic of the AGC. The smoothing of the AM signal was just the AGC doing its job with a much-reduced operating range (due to the severe limits imposed by the RF gain), and the blinking of the sync "S" was an indication that I was actually LOSING sync-lock.

Now that I better understand the dynamic of this circuit design, thanks to Rado's tenacious research, I am beginning to gain more appreciation of the benefits of the now-improved synchronous AM to the R75.

I would not however, recommend this modification for everyone! My "trick" use of the RF gain control which I described earlier, will still produce improved results for many users (or, by simply using the time-honored technique of ECSS tuning). Even though I incorrectly believed the sync detector was working better, the bottom line (improved results with fading and distorted audio) may justify trying my method, for those who are unable or unwilling to perform the installation of the capacitors.

What a beautiful improvement these modifications would be, if adopted by Icom (perhaps with even further research under lab conditions, Icom could redesign not only the circuit, but select a different IC for the R75's sync detector)!

While I still do not regard synchronous AM detection with the same enthusiasm as many of you in this e-group (it will not likely move higher than sixth- or seventh-place on my list of primary receiver judging criteria), the feature HAS gained increased merit with me and improved my R75's already-superb performance.

Thanks to everyone involved with the mods and the great feedback!

299. THUMBS UP FOR THE DX-SWL ANTENNA!!

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-16 01:26:00 UTC
From: Danny Blackburn
Topic: 299 Message: 299

If anyone has considered (and has enough space to put it) purchasing a top-notch multi-band wire antenna for their SWL activities, I would like to suggest the Alpha Delta model DX-SWL Sloper. I have owned one for many months now, and this amazing antenna is the finest wire antenna I have yet used.

Approximately 60' (just over 18 meters) in length, not including its counterpoise/ground leg, the antenna covers a very wide portion of the HF spectrum. The antenna is heavy-duty, with large-guage jacketed wire construction.

The antenna has withstood extreme thunderstorm winds, winter gales and every type of precipitation, with no signs of wear or damage. During a recent winter storm, the sloper became covered with a layer of ice and snow so thick, the antenna looked like white Christmas-tree garland. It was so laden-down that I could reach up and touch it from the ground, when normally its lowest point is around 3 meters at the dead-end of its slope.

I used a wooden rake handle to knock off the accumulated ice and snow, and the antenna sprang right back into position with no noticeable sag from its usual position!

Not only has this antenna proven its worth in strength and durability, it also outperforms every wire antennas I have used. During its construction and raising last spring, I had the opportunity to perform a side-by-side "A/B" comparison with another antenna I had been using for SWL work, while still up and operating.

Using a coaxial switch, I selected the two antennas alternately on signals in the BCB, 60-, 49-, 31- and 19-meter SW bands, as well as amateur radio signals in the 75-, 40-, 20- and 12-meter bands. In nearly every comparison, the DX-SWL brought between 1 and 3 full "S" units improvement over my old antenna!

The only exception to this was the 12-meter ham band contacts, where the Alpha Delta gave virtually no noticeable improvement in signal strength---but the antenna DID give noticeably quieter reception, not only on 12 meters but all bands tested, as well. I suspect that the DX-SWL has more "nulls" in its radiation pattern on 12 meters than my old antenna, which may explain the lack of noticeable "s"-meter improvement during testing on that band.

Since the DX-SWL is a "sloper", it takes up less space than most large antennas, and is much easier to erect and maintain. Mine is supported at the feedpoint-end by a steel tower, approximately 23' (7 meters) above ground, sloping to a short mast tie-off at its dead end

approximately 3 meters above ground.

I have also used the antenna for amateur transmitting with good results (7 watts PEP into the antenna got me contacts into Wyoming and Florida one evening!).

I would highly recommend this fine antenna to anyone considering improved performance over a random-wire or monoband dipole.

Thanks for reading my post!

I think the deal is that if you have the EXP ON and you have installed optional filters, you can use them in the setup of the wide/normal/narrow selection for each MODE that you wish to set filters for.

I remember having to turn it on before I could get the optional filters to work :)

Hi Danny,

From what you describe I think you found one of the first versions of the mod - described in a message by me. Check the last version - PDF file in the Files/R75 mods folder of the group. Filename is "R75_AM_and_SAM_mod_VER11.pdf ".

> Instead of installing a 47uF cap between IC pin 23 and ground, I

> dividends to have the sync re-lock more quickly.

The value I use is 100uF. I prefer slower (i.e. stabler) synch. There is also an additional resistor to slow the PLL lock/delock even further.

> I also compromised somewhat with the capacitor value used on pin #4.
> Assuming that a 470uF capacitor was only borderline-sufficient, yet
> not really wanting to more than double it to 1000uF, I chose a 660uF
> value to perform the task of slowing the IC's hyperactive AGC.
> Again, the results are completely satisfactory for me.

The value of the AGC cap. in the last version of the mod is 220uF. This is enough.

> A previous post of mine to this site, detailed my observations of my
> unmodified receiver, and the use of the RF gain to "bury" a signal.
> What I interpreted as an action by the sync circuit, was apparently
> only a characteristic of the AGC. The smoothing of the AM signal was
> just the AGC doing its job with a much-reduced operating range (due
> to the severe limits imposed by the RF gain), and the blinking of the
> sync "S" was an indication that I was actually LOSING sync-lock.

Yes, this technique works. The signal is just above the threshold of the PLL lock level. When the carrier fades then it goes below the threshold and the IC could not sense the de-locking. The IC has some "signal quality" circuit (pin 23 blend). For a strong signal if the carrier fades below the sidebands this circuit activates in a sense that it tries to lock again (but there is no carrier so it will "wonder" around the strongest signals in the passband) and thus distorts the audio. If however the signal is below the sensitivity of the "signal quality" circuit then it cannot sense the de-lock. So by reducing the RF gain you are bringing the sidebands below the threshold and the carrier stays just above. When the carrier fades everything is below the threshold and no distortion (the PLL will drift slowly). Hope this makes sense (this is how I understand the things).

> What a beautiful improvement these modifications would be, if adopted
> by Icom (perhaps with even further research under lab conditions,
> Icom could redesign not only the circuit, but select a different IC
> for the R75's sync detector)!

I sent the mod information about a moth ago to Icom but got no answer. :-(

Best regards,

Rado

Any suggestions on how to make pin 23 mechanically stable once it is lifted off the PC board? I've considered covering the joint with hot glue once the solder connection is made to keep mechanical stress from breaking the pin off from the body of the IC.

73,
Alan

Hi Alan,

Unless you pull the wire there is no mechanical stress on the lifted pin.
Hot glue will make a mess.

Best regards,

Rado

304. IC-R75 Price w/DSP?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-18 00:55:25 UTC
From: peterg5729@aol.com

Greetings,

I'm ever-so-close to purchasing an IC-R75, but I'm a bit confused about the current offer. Does anyone know if it's $200 off with free DSP or is it just $200 off? I apologize for posting this kind of message, but I couldn't find an e-mail link anywhere on the ICOM web site.

Thanks,

Pete

My understanding is that the free DSP offer is over. It has been replaced by the $200 price reduction.

Just ordered mine from Grove (actually spent some time on the phone talking about the R75's features with Larry Van Horn, got some very good advice).

Pete,

The best information is what I got from Universal Radio http://www.universal-radio.com. The $200 off coupon is still good until 3/31/01. The free DSP offer was separate and expired as of 12/31/00. I only know this because I just bought my R75 from Universal on 12/29/00. The resultant price at Universal is $569.99 plus $14.95 shipping and a free book: "Joe Carr's Receiving Antenna Handbook".

I am really happy with the R75 purchase! I think that the price is a bargain for the performance even without the free DSP unit.

Mike Failing

According to Universal Radio's website, the $200 off deal is good until the end of March, but the free DSP offer ended December 31, 2000.

Jim,

I would agree that the audio seems somewhat less muddled when the DSP feature has been deactivated, but I would also advise you to check the level according to the manual and see if you can't find a point where you are happy with the results. I have used the DSP when it was necessary and was very glad indeed to have it.

So the DSP is more than Autonotch and Noice reduction then?????

I thought the DSP was only these 2 things. I dont know because I have had my DSP installed from the first time.

Do you know or someone else what the DSP does or does´nt ?

Even if you don't like the audio thru the noise reduction, I feel the DSP is worth it alone, for the Notch Filter function. This really makes tuning SSB signals very nice, as it masks nearly all carrier heterodyne interference, and can sharpen your reception quality somewhat. If you really don't want the DSP unit, there are a number of R75 users in this group who'd LOVE to have it! Post it for sale!

From: Mark Goad
Topic: 320 Message: 320

I have an extra D.S.P. Unit if someone needs one. I'll trade it for something cool or for cash. I love my radio even though I haven't done any mods to it. Mark.

321. Rado mod !

From: Enrique A. Wembagher
Topic: 321 Message: 321

Hi list !
I made the mod of Rado and it works really well!
I also installed dsp unit and he works well, although I don't with a MFJ 784b dsp, but I am happy with the UT106.
Thank you Rado for your investigation!
Cordial greetings,

The thing I disliked most with the DSP connected was the signals on the BCB seemed to rapidly fade up and down at about a 1.5 second rate. When I disconnected the DSP the problem went away (at least to my ears). Jim

I've never heard of that before! My dsp works just fine.
Were there fading conditions on the signal at the time?
For me a noise reduction setting of 4 works best.
Try it some more and let us know what happens.

Keith

A general discussion newsgroup on shortwave radio, stations,
propagation, equipment, publications, etc., and lately and
unfortunately, flamings and disputes of all kinds and of little value.

See it all at: rec.radio.shortwave

I am certainly glad you posted this SECOND follow-up, Jason! (lol)

Derrik, the above newsgroup---NOT the first reply, is the e-group I
was referring to. The older and gone-off-the-
edge "rec.radio.shortwave" is no site for any real SWL, and the
egroups address is a newer and much better forum.

Thanks for the reply (second one), Jason!

329. A Good ICOM Vender

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-22 01:25:08 UTC
From: paulpasternak@hotmail.com
Topic: 329 Message: 329

There are a couple of stores in US that are offering good deals on the 75: Universal and Lentini. Which one provides the best customer service? Or is there another company out there that would be better to buy it from. I am in Canada, so it will be coming across the border.

Also, can someone recommend appropriate optional filters to dig out weak/barried signals in the broadcast band?

What is a good external speaker to improve audio quality for BCB listening? I was thinking of attaching some amplified speakers with bass and treble controls. Has any one tried that and what results did you get? And a decent pair of headphones...what would you recommend?

Any comments in part or whole would be most welcomed.

Cheers, Paul Pasternak, British Columbia

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-01-22 03:51:37 UTC
From: Lisa and Bill
Topic: 329 Message: 331

Hi all;

beware, I am about to babble a lot of thoughts I've been saving up.
I apologize...

1. I live about 15 minutes from Lentini (in Newington, CT), and
bought my R75 there last January. They were very professional
and I have no complaints whatsoever. I think they've been in
business for around 40 years, I know I first visited them at least
15 years ago, and they're right down the road from the ARRL (ham
radio's epi-center).

2. The audio, regardless of what anyone says, stinks in the R75.
For a $600+ radio, they could have done a heck of a lot better.
I mean, come on, audio circuits are cheap !

Maybe I should clarify. FM is super sounding. AM is harsh and
very high and mid-rangy, although VERY clear. I tried hooking the
line outs through my stereo, with an EQ, I tried some PC speakers
with a subwoofer, I tried standalone bookshelf speakers and then gave

up for a while.

The weird part was that everything I connected, including headphones
sounded too bassy. Even trying to EQ it down never seemed quite
right, and the clarity (that I did get from the built in speaker
never came through
on the speaker or line out connections.) I really can't explain why,
but
that is my feelings on it.

However; I recently picked up an Icom SP-20 on eBay (the one that
goes for $229). Hooked it up and it too sounded a bit too bassy.
Here is the funny thing. Just that same weekend, I replaced the
speakers in my wife's new car, a 3 1/2 inch speaker. Coincidently
the speaker in the SP-20 is a cheap 3 1/2 inch paper cone speaker. So
just for
fun I replaced the SP-20's speaker with the one from my wifes car.
Guess what. It sounds GREAT! Why Icom sells a $229 speaker box
with a .99 cent speaker in it is beyond me. The key here is that the
SP-20 has 4 low and high pass filters built into it. So I kick in the

high pass filter (blocks the lows) and AM, SW, etc sound perfect.
On FM, it sounds awesome !!! I am tempted to buy a $50 pair of
Pioneer 3 1/2 inch speakers and see if that is even better. Anyone
want to buy the extra speaker ????

3. The 1.6 MHz mod is definately worth it. Before I did it today, I was watching a signal on 387 khz which barely got the 1st LED on the S-meter lit. After, the signal was over 3db. There were even a few other signals down there that weren't there before. I do notice some extra overload in the 170's/200's if the preamp #1 is on, but otherwise
the mod looks to be a huge success and pretty easy... just drop a glob
of solder on the two copper pads. It's the easiest mod listed on this
group.

4. I have learned a lot from this list and one thing I'd like to point out
to anyone new to using this radio is that the use of LSB or USB on BCB/AM is a great way to pull out weak signals, or signals with interference. Someone had written about this a few months ago and I had laughed it off. Until I tried it a few times and found that they
were 110% right. Tonight I had 2 stations on 1070 (next to my local 1080, WTIC Hartford). The 2 stations were only somewhat clear on 1068 and at that still getting a lot of slop from 1080. I tuned to 1070,
kicked it into LSB and turned the twin PBT all the way to the right (I think of it as turning them towards the station you want to null). And like magic, WTIC was gone and CHOK from Ontario was clear as a bell. There was also a classical or beautiful music stations there
that wasn't audible in AM mode.

Also, if you do the S-AM mod. I too doubted that it really worked. It does, you have to believe and find the right fading conditions to be somewhat impressed.

5. I didn't think much of the free DSP (the radio cost $700 last year, so it's a darn good thing the DSP was free)... It does work ok, at maybe
a setting of 3 or 4. Past that it sounds digital. I wouldn't buy it if it hadn't
been "free".

6. The Noise Blanker is INCREDIBLE ! Turn on a torch-aire light and see !

7. The FM section from 30 Mhz to 50Mhz is INCREDIBLE ! I like to listen to the F2 skip from California in the 42's and the R75 blows away my Bearcat 800XLT.

8. I have saved eveyones emails about the 450khz and 3.3kHz filters. I have yet to sort this out in my head if someone can explain this to

me also. I would like to be able to have a tighter AM/BCB band without the loss of audio quality that the 2.4 KHz filter creates.

All in all, I couldn't be happier with this radio. I am somewhat unhappy that I had to spend another $150-200 on the external speaker and might have to dump another $100+ on a 3.3 khz filter. But, hey they are making a pretty wideband radio here, and I'm sure they had to cut some corners to get the price competitive (is $600+ competitive ???)

Thank you for all that valuable information. I wonder whether this
radio is worth it because I do enjoy good audio quality for listening
to BCB. I just returned the Satellite 800 because of poor contruction
(two versions came with the volume controls that put out static when
being turned/ the replacement also had a broken a/c power supply,
that's when I lost all confidence). Shoddy construction aside, this
radio put out wonderful audio quality with a Synch Detector with
USB/LSB that really worked. I'm concerned I will be sorely
dissappointed with 75 in this respect.

So you say it's a great radio...maybe for ham and utility listeners
only???

I haven't gotten any filters yet, but I'm planning on getting the FL223 1.9 kHz 9MHz filter, and the FL257 3.3 kHz 455kHz filter.

As for a good speaker, I followed someone elses advice and went to Rat Shack and picked up an RCA PRO-X44AV (RS #40-5001) 2-way speaker. It doesn't have any controls. Just the raw speaker. I think it was about $35 or so. It works quite well for me; beats the little internal speaker. Sounds very nice.

I'm also interested in headphone suggestions. I have a pair of Sony MDR-V1's which are nice and light with good sound quality, but I want full ear coverage to block out ambient noise for picking out those tough signals.

Have fun,

Keith

Prior to reconnecting the DSP, I did the AGC mod described by Rado. Now the radio sounds fine with the DSP connected. I have the level set at 3 and am happy with the audio quality and DSP functions. Thanks to all for your input.

As the Founding Fathers knew well, a government that does not trust its honest, law-abiding, taxpaying citizens with the means of self-defense is not itself worthy of trust. Laws disarming honest citizens proclaim that the government is the master, not the servant, of the people.

337. r75 audio plus rambling thoughts

Yahoo group: icomr75 (2000 — 2002)

From: Jem Cullen
Topic: 337 Message: 337

regarding the r75 audio, yep its horrible!
was one of the things i found disappointing when i first got the radio.

However with a bit of work i have managed to make it sound great. First i did Rado's mods (yikes!). The agc timing helped heaps and the sync is useful too!

However the biggest thing was i found a car "graphic equaliser/booster amp" on clearance at a car hifi shop for $20. one of the fader, plastic knobcaps was missing and it had no mounting brackets but who cares (found a slider to fit in my junk box). Hooked that up to a quality twin cone car stereo speaker built into a box about the size of a shoebox. Connected it to the 12v power supply i use to feed various radios etc here (Icom ps15-20 amp). Sounds stunning! Listening to clear broadcast is beautiful and the little graphic equaliser is great for digging up signals and i can set curves for ssb/am/and various interferances! Its even black and fits exactly between the two topscrews onthe rig..looks great sitting there. feed it from the external spreaker jack on the back of the radio.

Other thoughts. someone said pity the sync iisnt selectable side band. Well what about using 2.4 filters, detuning about 1khz or so and using the passband, I'm actually doing this instead of ecss lately.

The other thing i have learned to do is TURN THE AGC OFF when listening to weaker signals (mostly with ute). Im amazed how much the agc muffles low signals. pity it breaks up so badly with agc off and stronger sigs.

As for filters, well cant afford any at the moment, but i think the 3.3/1.9 combo is for me.

Just realised, this is my 4th Icom radio. (got IC-740txr, ic-255 2m, and used to have IC-720a Txr) also icom psupply and AutoATU. Dont plan it that way, just end up with icom every time. settle for the best!
(also have sangean 803a and used to have sony icf6700w, drake ssr1, kenwood r5000 -a great rig and various other boxes for hf/vhf/uhf)
73 and good dxing

From: Hamilton, William
Topic: 338 Message: 338

I ordered my R75 on 29Dec and thus still qualified for the free DSP. I sent in the paperwork on 9Jan and received the unit yesterday. I must say that I am impressed by the performance of the unit. I know some on this group are not very positive. Perhaps it depends on your listening profile. Essentially the DSP allows you to seperate the information from the noise. I find it especially valuable when I need to use the preamp. Of course, it cannot add any information to the signal that is not already there.

It's an issue of comprehension vs. quality. If you need to hear a station -- the DSP is a must-have item. For tonal quality the DSP can reduce the satisfaction with the listening experience.

For $580, I don't see anything close to the capabilities of the R75. I do want to get an outboard speaker and I need to upgrade my antenna situation.

Regards ...Bill

Hello Jem:

As a dedicated program listener/SWL'er and casual DX'er I don't think 75 fits my listening needs. Forking out all that cash (1,800.00 at least in Canada, with DSP, extra filter) and then having to fiddle around with audio is not my idea of good value. I'm not a ute/ham listener so this radio doesn't make a whole lot of sense. The filter sizes are not right for decent audio on broadcast band: they're either too narrow or too wide. I think the way this radio is being adversited as appropriate for good SWL'ing is questionable at best; especially since the synch does not work properly. Bottom line: if I was going to spend that much money in Canada as a BCB program listener I would get a Drake R8B instead, because the synch works, the filter sizes are more appropriate for bcb listening and the audio does not need to be finessed with jerry-rigged homemade contraptions.

I am writing this more to inform others of my research from reading this egroup and talking to various radio dealers.

73's and happy listening.

The audio does not require much fiddling. Just a good quality external speaker. The Icom R75 does not suffer from bad audio, only from a too-small internal speaker and no tone control (although the twin PBT will help remedy this in nearly all cases). People who try to get MacIntosh-quality audio from a SWL receiver, are in the wrong hobby!

I'm not a ute/ham

There are shortcomings with the R8B which make the Icom the better choice for the money. The R8B does not exactly "shine" in the built-in speaker department, either (check Passport to World Band Radio for more on this) so with either receiver, a good external speaker is a must.

As for the filters, the 3.3-KHz and 1.9-KHz options prove adequate. The R75 "stock" 6-KHz filter is reported to have a 7.1-KHz bandwidth at its bottom skirt---pretty darn good, especially for BCB and general SWL-ing. I have added the 3.3 for tightening the AM in crowded band conditions, but I mainly use the time-honored ECSS method of extracting the best audio from a signal, and "bump" any adjacent interference with the PBT controls---something you CAN'T do with a Drake, because it has NO twin PBT controls to improve its

filter response.
>

Some in this group do not know anything but "sync-AM" when comparing performance. Sync-AM is NOT a panacea, far from it. Put great synchronous detection in an otherwise-mediocre receiver (Drake SW2), and you have a great synchronous detector with a mediocre receiver! Take a great receiver like the R75, give it a non-functioning sync detector, and you still have a great receiver with an easily-modified (and for just a few cents' worth of parts) sync detector.

Jem, you should try listening to any number of "horrible" speakers in some pretty expensive gear. Don't forget, some of the very finest receivers in history, came WITHOUT any speakers! You don't see Collins or Hammarlund owners complaining, so do as they do, and get a decent speaker instead of diddling with automotive-grade junk. By the way, did you remember to isolate that equalizer's inputs from the output of the Icom? It would be a costly lesson to have the common-ground 12-volt input lead on the EQ cause an unpleasant incident with the audio output from the Icom!

Not really audio related, but yes, very useful. Rado did a great job with his painstaking research, for the greater benefit of many in this group!

It is the RECEIVER that is doing the "digging", don't forget!

and i can set

Good choice. These are what I use, and the results are very
satisfying!

And I agree that Icom is, indeed, very fine equipment. 746/207H/R75
are very good examples of this. Icom's 756-Pro is among the most
respected amateur transceivers available, along with the 746.

Jem;

I tried the EQ thing also and while is did sound ok,
the EQ introduced a "background hiss" that I did not
like. Maybe it was the cheap EQ I bought and a better EQ
would have been better. Just my opinion for what
it's worth.

I also own the R8500 and occasionally use it on SW. The built in speaker
on it is very bad too in addition to ICOM stuffing it into the right rear area
of the radio. At least ICOM can get credit for placing the R75 built in
speaker on the front panel producing a front firing arrangement. Their
choice for the size of the speaker was a bit too small though.

I personally use the Radio Shack XTS-25 optimus speaker that used to
sell for around $15 when on sale. Sounds decent and looks good too.
Not too sure if they carry it anymore.

There is a night and day difference with this hooked up. I am listening
to 75 mtr AM ham transmissions at the moment and they are rich and full
sounding on the R75 with the external. Once I disconnect the external and
rely on the front firing speaker the sound gets quite tinny. Not much low
frequency response with it. I noticed when I did the Rado mod that ICOM
did stuff some foam in behind the speaker in the R75. This built in speaker
could possibly have sounded better if ICOM had placed it in its own
enclosure inside the R75.

I also wish they would have allowed a little more room on the front panel
for the relocation of the AM,FM,SSB and other mode buttons to be placed
away from the tuning knob for easier access. All in all the radio front panel
is arranged in a very logical manner.

Eddie

Does anyone have any opinions on how the r-75 and the yaesu FRG-100B compare?

They are both around the same price, $569.00.

Thanks,

Speaking of AGC mods, has anyone ever done one on a Kenwood R5000? I love that radio , but the audio recovery rate between static crashes is ridiculously long. Jim

I am looking for the best audio quality possible within the scope of Shortwave Radio Listening. I do understand the limits of audio on shortwave; I started out with a Realistic DX-160 twenty-five years ago. And I've owned many other radios since. Now I am looking for a top of the line listening quality. You recommendation of a type of external speaker is appreciated. 73 Paul

Subject: Re: [icomr75] Test

I upgraded from an FRG-100 (not the "B" version - only difference is the filter characteristics) to the R75 with DSP, and have absolutely no regrets.

The FRG-100 is a value for money and underrated receiver but the Icom is worth paying the little bit extra for. Additional features/benefits include:

1) Notch
2) Passband tuning
3) Audio DSP option
4) Keypad frequency entry without extra expenditure
5) More filter options, and generally superior filtering
6) Better dynamic range
7) Better mediumwave sensitivity
8) Coverage up to 60 mHz (Yaesu only goes up to 30 mHz)
9) Two-level preamp
10) Two antennas selectable from front panel
11) Better software support
12) Lower noise floor

I could go on, but there's really no decision to make if the costs are comparable, or even if the Icom is more expensive (as it is in this country).

I want to thank everyone for their opinions.

I have decided to buy the R-75, even if it costs a little more.

Thanks to everyone again,

Bob

351. R75 DSP?? and VR 5000 comparison

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-02 22:29:03 UTC
From: michael.leblanc@tellabs.com
Topic: 351 Message: 351

I just bought my R75 and love it. I owned an R71 and an R72 and the R75 is much better than both.

I bought the new VR-5000 and took it back after 24 hrs of trying to tune just 1 signal without front end distortion. If you put more than 20ft of antenna on it in HF it sucks. It's much to hard to program a memory channel. I read all the posts on the egroup for the VR-5000 and most of then said it was a great radio. In my opinion they were way off the mark.

My real question is if the internal DSP for the R75 is recommended and does it really work??

Or should my money be spent on an external unit or filters??

Michael LeBlanc

Michael,

I spoke to Roberto today and you must be the guy he spoke of regarding the VR-5000 and the R75. I have an R8500 but still went and bought the R75 and could not be happier with the R75. The current pricing makes the R75 a steal of a deal.

> My real question is if the internal DSP for the R75
> is recommended and does it really work??

You will hear mixed opinions of the DSP unit. Luckily I got mine in December when it was still included for free. I think that it is worth it for serious DXing. I have pulled in signals that would have been unreadable but for the R75's 2nd preamp and DSP working together. The only thing to remember is to not overdo it on the DSP setting. Settings in the 3 to 6 range can work wonders on some tough signals. Too high a setting muffles or muddies the sound. Based on reading the old postings on this board, and some listening hours on the R75, I am saving for at least the 3.3 kHz filter. I would say that both the DSP and the filter are valuable additions at least for me.

> I read all the posts on the egroup for the VR-5000
> and most of then said it was a great radio. In my
> opinion they were way off the mark.

As for the good opinions on the VR-5000 I hope those were scanner users in VHF and UHF because the sensitivity numbers in HF are simply uninspiring and your distortion observations do not improve matters to me.

Mike Failing

While I have never owned an R71 or R72, I have owned two different Kenwoods (R600 and R2000), two Drakes (SW1 and SW2), two Yaesu FRG-7s, and four Realistics (2-DX160, DX100 and DX302). The R75 blows them all away!

The VR5000 is not really comparable. It is much more a "scanner" than a worldband receiver, in my opinion. It is probably an excellent radio in its own right, but it would be like comparing an SUV to a proper truck. Similar, but designed for different things. It is generally not a good idea to expect a wideband scanner to perform well on worldband, so the comparison really does not justify itself. Too bad I can't afford BOTH receivers!

> My real question is if the internal DSP for the R75 is recommended
and
> does it really work??

Most assuredly, it DOES work. I never set mine above a 3 or 4, but the real value of the DSP to me, is the ANF feature. I do a lot of SSB monitoring and ECSS tuning on worldband broadcasts, and the ANF notch function is a real blessing. Really works well.

> Or should my money be spent on an external unit or filters??

Filters, yes. I recommend FL-257 for AM and SSB-wide, and FL-223 SSB narrow. I have had good results with these two filters.

From: Mark J. Fine
Topic: 227 Message: 354

Icom List,

Based on a tip by Roger Swearengen, a small bug was found that made the serial rate stick to 19.2 kbps when ever the Options was displayed. A fixed version (Version 3.24d) has been uploaded to our web site at: http://www.fineware-swl.com/sic.html.

Upgraders are reminded that they should install the update using the "Compact" option, which only updates the executable program.

355. R-75 vs AR-7030

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-04 16:03:58 UTC
From: pbigelow@us.ibm.com
Topic: 355 Message: 355

Hello,

My first post. This is a very nice group with LOTS of information.
Anyone contemplating purchasing an R-75 would do very well to
come here for research.

A request was posted a while back concerning the R-75 vs the AR-7030.
Here is a site (in Japanese?) that seems to compare the receivers.
Tried to find an English translation but did not find it.
A fairly wide spectrum of frequencies are compared. Cannot
determine the test conditons -- antenna switch, level matching, etc.
Does the absense of data for the AR-7030 indicate no signal
received? If so, that's a lot of "missing signals"!

The site:
http://www.asahi-net.or.jp/~TC3T-KNI/swl/j/icr75.htm

If anyone has any further thoughts, (or can translate the
referenced page!) they would be appreciated!

Has anyone on the list been able to compare the two receivers?
How do they compare:
1) Images/Overload
2) Internal generated noise (birdies, display noise, etc.)
3) Tuning lock speed. Does the tuning SOUND smooth? That is,
no pings and thumps while tuning like old synthesized receivers?
(JRC NRD-525 is poor in this regard, for example)
4) Longwave sensitivity

Has ICOM ever responed to the SYNC modification?

Best regards,

Paul Bigelow

Hi,

I have ordered the computer interface and control software for the IC-R75.
I was wondering what experiences people have had controlling the IC-R75 by
computer. Are there any other software programs that can be used to control
it (scancat etc..)

Thanks
Ross

Try Fineware's Smart Icom Control: http://www.fineware-swl.com/sic.html .
Also, if you want to use the ILGRadio Database
(http://www.ilgradio.com/ilgradio.htm) with your receiver, get Radio
Listener's Database from http://www.fineware-swl.com/rldb.html .
I understand the next version of Smart Icom Control will also work with
ILGRadio.

359. Sync detector mod and other questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-05 21:43:03 UTC
From: Paul Bigelow
Topic: 359 Message: 359

Hello,

Questions concerning the Sync mod:

After the modification is there any lock range at all or does
the station need to be retuned as the receiver and, possibly,
the station drifts? If so, the TCXO would help with receiver
drift, correct?

The synchronous detector as used in the Sony 2010 whines as
the station is detuned from the frequency. Does the R-75
perform similarly after the modification?

What is the effect of the Twin PBT on the sync detector?
Is is possible to select upper or lower sideband with the
PBT after the mod?

About the R-75 in ECSS:

How well calibrated is the SSB with the R-75 when selecting
USB or LSB when tuning an AM station? That is, are there any
undesirable pitch changes when selecting USB, LSB when
precisely tuned to an AM station? Ignoring the effects of
the IF filters, if properly calibrated, there should be no change
in pitch.

Tuning quality:

How many steps are used in the R-75 tuning encoder?
Is the encoder mechanical or optical?
Is there any wobble in the encoder shaft?
Is there any "chuffing" while tuning?

Best regards,

Paul Bigelow

RE:
The R75 does not drift appreciably. The TCXO addition will improve the stability of the unit, but in my opinion the slight and almost unmeasurable gain in stability is simply not worth the extra cost.

> The synchronous detector as used in the Sony 2010 whines as
> the station is detuned from the frequency. Does the R-75
> perform similarly after the modification?

RE:
Mine does, but only after detuning by just over 3KHz either side of the carrier frequency. Unlike my earlier Drake receiver however, the sync will re-acquire lock without the need to disengage and re-engage the sync function. 3Khz is a tremendous amount of shift for a signal, one that I have not encountered in practice yet since performing my modification.
>
> What is the effect of the Twin PBT on the sync detector?
> Is is possible to select upper or lower sideband with the
> PBT after the mod?

RE:
The twin PBT is disabled during synchronous operation. It should be noted here that by using ECSS mode, one can effectively "twist out" the interfering sideband with the PBT controls, after first determining the best sideband mode to use by A-B comparison. For this reason, I do not feel that the sync mods are as critical in the R75 as perhaps they would be in a lesser receiver, because of the tremendous flexibility of the R75's excellent PBT functions, particularly if the receiver is equipped with the almost-mandatory optional FL-257 and FL-223 filters. This is only MY opinion, others may feel more strongly about the need for the full-blown sync mods. The R75's superior selectivity and twin PBT features actually enhance the value of synchronous AM (by making it LESS necessary), not the other way around, in my opinion.

>
RE: I cannot speak for anyone else's R75, but mine is exceptionally close, less than 8 Hz on LSB and 2Hz on USB when comparing WWV signals. I have noticed a bit of "bending" from time to time because of time-phase and/or ionospheric shifts when conditions are in flux, but otherwise it is near-perfect.

> Tuning quality:
>
> How many steps are used in the R-75 tuning encoder?
> Is the encoder mechanical or optical?
> Is there any wobble in the encoder shaft?
> Is there any "chuffing" while tuning?

RE:
The R75 has an extremely stable tuning knob, and comes with an adjustable "clutch" to vary the turning ease. There is no "chuff" involved, the R75 tunes as smoothly as any analog VFO I've ever used. The display can be selected to read down to 1-Hz increments, and it is possible to observe 1-Hz step "runups" with slow dial movement. This is definitely NOT the case with my scanner and my old Drake, with their "flup-flup" incremental sounds and detent notches. Definitely a smooth, substantial-feeling knob that will flywheel quite nicely if required. Smooth as silk!

Hi Paul,

> After the modification is there any lock range at all or does
> the station need to be retuned as the receiver and, possibly,
> the station drifts? If so, the TCXO would help with receiver
> drift, correct?

The lock range is about +-3kHz. Don't buy TCXO - the receiver is very stable without it. Spend your money on filters and DSP. You'll need TCXO only if you are operating outdoors (for example) where the ambient temperature can vary a lot.

> The synchronous detector as used in the Sony 2010 whines as
> the station is detuned from the frequency. Does the R-75
> perform similarly after the modification?

If the PLL lock speed part of the mod is performed (more stable synch) then it will whine for about 1-2 seconds. The whines are masked very well by the ANF (auto notch filter) of the DSP.

> What is the effect of the Twin PBT on the sync detector?
> Is is possible to select upper or lower sideband with the
> PBT after the mod?

The PBT works. It is possible to select only one side band. But the bandpass skirt is not as sharp as in the SONY (the sony uses phasing method for sideband selection). Use the 9MHz PBT knob (outer one). This way the 450kHz IF won't shift when shifting the passband (synch won't de-lock). If you use the 455kHz knob and rotate it fast you'll hear whine (as the IF shifts).
Two advantages of using PBT instead of de-tuning:
- the display will show the frequency of the station
- no whine

> How well calibrated is the SSB with the R-75 when selecting
> USB or LSB when tuning an AM station? That is, are there any
> undesirable pitch changes when selecting USB, LSB when
> precisely tuned to an AM station? Ignoring the effects of
> the IF filters, if properly calibrated, there should be no change
> in pitch.

My R75 as it came from the factory is 5Hz up. I won't bother adjusting it unless it is more than 10Hz. A lot of stations however are off-frequency (especially the DX catches :-). I can't detect any carrier shift between USB and LSB - it is less than 1Hz. (I use SPECTRAN - very nice software ... get it)

> How many steps are used in the R-75 tuning encoder?

The encoder is "Copal Electronics" (http://www.ktpc.or.jp/kp/101610/product/p18.html) RMS20-250. It generates 250 pulses/revolution. Depending on the tuning step however the CPU will "re-bin" the steps. So if you select 1kHz tuning step one turn of the knob won't be 250kHz (as I recall it is 50 kHz).

> Is the encoder mechanical or optical?

It is magnetic (not mechanical).

> Is there any wobble in the encoder shaft?

No.

> Is there any "chuffing" while tuning?

No.

Best regards,

Rado

362. Re: [icomr75] Re: Sync detector mod and other questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-06 14:54:11 UTC
From: Paul Bigelow
Topic: 359 Message: 362

Hello,

Thank you Rado and Dan for your very informative answers and experiences.
The R-75 seems to be a much more welcome receiver than the R-72!
A few further questions, please:

How does the R-75 perform with strong signals? Are any detectable images
or intermod products produced with strong signals -- for example, S9+40 or
S9+50?
My Kenwood R-1000 starts having problems with signals S9+20 or S9+30.
With a good outdoor antenna signals of that strength (or even stronger) are
not uncommon these days. An attenuator can help, of course, but its use is
not
desirable.

Kind regards,

Paul Bigelow

363. Response from ICOM

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-06 22:35:48 UTC
From: Paul Bigelow
Topic: 363 Message: 363

Hello,

I received this response from ICOM concerning the S-AM (their capital letters):

WE ARE NOT AWARE OF ANY PROBLEMS WITH THE S-AM FOR R75 NOR OF ANY FACTORY MODS.

THE S-AM IS DESIGNED TO ENHANCE SIGNAL RECEPTION WERE THE SIGNAL LEVELS FLUCTUATE AND ACTUALY GOES TO ZERO....THE S-AM RESTORES THE SIGNAL UNDER THIS CONDITION. IF THIS TYPE OF SIGNAL CONDITION IS NOT BEING RECIEVED THE S-AM DOES NOTHING DIFFERENT THEN STANDARD AM DETECTION.

I have requested a clarification but if I understand ICOM's response correctly,
the S-AM is not supposed to operate unless the signal is virtually absent (or
even NO signal). That is, the benefits of S-AM under strong, medium, or even
fairly weak signal conditions are not part of the R-75 design and that the design is intentional.

Is ICOM's response new information? Responses?

Kind regards,

Paul Bigelow

364. filters.

I'm intending on purchasing the Icom DSP unit and filters but all the posts here have confused me.

I listen to AM broadcast, SW and sideband utilities. What filters are recommended for both the 9KHZ and 455MHZ positions.

What filter settings on the R75 should i use.

Michael LeBlanc

Topic: 363 Message: 366

Hello,

Point well taken. The easiest ways for a corporation to dismiss a problem is: "We are not aware of any problems", "Working as designed", and "If it isn't working as designed, change the design". Beleive me, I know ALL of the tricks.

That is why I followed up my initial inquiry with quotes from reviews and pointed to other general opinions. ICOM Japan was sent the note also.

I do not have an R-75 (yet) but to be fair to ICOM, does the R-75 perform as their response seems to indicate it should and which may have been the intended design: The sync detector is supposed to work under fading conditions when the signal strength drops to zero.

This point is important because if it does do as they say then instead of approaching ICOM with "your sync detector is broke", they can be approached with, "your sync detector seems to be working as designed, thank you, but we have another idea based upon user experience. How about this new way....". Becasuse if they are told that it's broken and the designer says it's operating correctly and then presents the data to prove it, no changes are going to be made and the critics look like amateurs -- obviously, because the critics are wrong so they do not know what they are talking about. However, if it can be determined that the sync is working AS THEY INTENDED but that there could be another, better way... at least it is recognized that the critics are experienced enough to see what is working but have a constructive suggestion.

The bottom line here is that the sync detector may not be broken or even incorrectly implemented -- it is just implemented differently from what we, as users, expect. Perhaps it could be implemented differently once again.

In any event, I await further response from ICOM.

Best regards,

Paul Bigelow

367. Second response from ICOM

Yahoo group: icomr75 (2000 — 2002)

From: Paul Bigelow
Topic: 367 Message: 367

Hello,

The second response from ICOM (their capital letters). Not encouraging.

THEIR COMMENTS ARE INTERESTING.....I'M SURE THAT IF YOU CONTINUE TO SEARCH
THE INTERNET YOU WILL FIND MANY OTHER INTERESTING REVIEWS AND
COMMENTS.......

I SUGGEST YOU GO TO YOUR LOCAL LIBRARY AND GET A TEXT BOOK ON ELECTRONIC
ENG
AND LOOK UP S-AM DETECTION...THESE CIRCUITS ARE GENERALLY DESIGNED AROUND
THIS DEFINED CRITERIA. ALSO KEEP IN MIND THAT COST OF THE R75 IS IN THE
ENTRY LEVEL CLASS....IF YOU NEED PERFORMANCE ABOVE THIS THEN A HIGHER
QUALITY (COST) UNIT MIGHT BE BETTER FOR YOU.

I have responded to ICOM and await further comments.

Best regards,

Paul Bigelow

ouch!

i'm still contemplating a purchase of an ic-r75 this week, and am always dismayed when a large company responds condescendingly to honest questions...

however, their behavior is no different from other large radio equipment companies i've dealt with, and am just happy that someone like Rado is willing to explore improvements for the benefit of the group.

DJB: This fuss over synchronous detection is a distraction. ICOM is not likely to act upon any design changes, even with the proper user research such as that conducted by Rado. It should be kept in mind, that the problem is quite simple to fix. Even if one chooses NOT to perform the modifications, there is really very little lost on the part of the buyer of an R75. The cost of the R75 is, indeed in the entry level class, as stated above. I would be very, very surprised to see the R75 continue in production much longer, let alone in a re-engineered format.

Take for example, the hoopla surrounding the Grundig "large-as-a-satellite" 800 Millenium. This beast was the focus of some very intense R & D work, marketing/P & R and production work, no doubt worth millions. The newest version of the 800 does, indeed bear some improvements over the initial production model. However, the unit is very likely the most over-hyped receiver in modern days, and for all the attention and co-operation on the part of Grundig to produce a new "people's radio", the unit still falls short in many respects.

This is clearly not the case with the R75. Even with the comparatively minor snag with the sync AM circuit, the unit utterly blows away anything else in its class, on merit of its low cost alone. Think of it this way: If the R75 was not even equipped with ANY synchronous detector, it would not be a bad bargain at its

present cost levels, at least here in the US where it is available under $570 as this is written! The R75 is jammed full of features and performance quality that are simply not available without spending a great deal more, say on a $1200 R8B Drake, which I consider to be the R75's closest rival, but because of its higher cost it surrenders much value to the R75.

When one considers the quality of construction and the otherwise-superb engineering that can be had with the ICOM, the lack of synchronous AM function is quite minor, especially since the "fix" is not all that complicated. If I had a new car that could be easily improved for a few cents' worth of parts and the time it takes to unsolder and lift a pin from a circuit board, even if the manufacturer did not implement the change in the factory, I would be very happy to do so.

Readers of my posts to this group will know that I am not a great fan of Sync AM in the first place, and I don't mean to belittle its importance to those who feel the feature is absolutely crucial to their life functions! I just think, entirely too much worrying about Sync AM detracts from the main point, and that is the ICOM R75 is a top-drawer receiver for a price that more easily fits many lower-quality units.

I am tempted, in fact, to pick up another R75 at these low prices, while they are available. Who knows, with receivers dropping from product line-ups every couple years now, the R75 may just be tomorrow's sought-after commodity!

For those interested at all, I find it a good point of reference to use the Grundig YB-400 Yacht Boy portable, as support for my opinion on Synchronous AM. In one popular publication, the YB-400 is one of two portables to earn the editor's TOP honors, in a virtual tie with the Sony 7600G. The Sony has one of the more well-regarded synchronous AM circuits available, especially in a portable. However, the YB-400 totally lacks sync AM. If the feature were as all-important as many seem to feel, including the editor of that publication himself, then the Yacht Boy would surely not be able to occupy the spotlight in such an esteemed position!

The fact that the R75 at least has a pretty fair sync AM circuit, but has apparently been installed incorrectly and is easily remedied (thanks to Rado's hard work), is like having to open the little prize that is stuffed into a box of cereal--It's right there, but takes just a little effort to unwrap it!

Sorry for the OT posting!

Danny

I agree with Danny. I grew up on R4's, 75S and R-390's, with a few odd balls thrown in. My first radio with sync was a Sony 2010, and while it worked very well, I rarely used it.

Just for grins I drove 130 miles today with the R75 in the passenger seat connected to a Wilson 1000 CB antenna, and I listened to the net on 14.300 USB. Great copy the whole time from an antenna limited setup.

I think this is a great receiver, with very nice options for performance improvements.

Not to slight Rado, he did a wonderful job in finding performance mods for the AM sync purists that hang out here. Lots of hard work on his part.

I would be more interested in performance mods like tighter filters, lower noise floor, better noise reduction/blanking, etc.

just my 2 cents worth...

I don't think you will be dissapointed with the R75.

Even without making the Sync mod, this is a good reciever. Using it in ECSS mode work very well.
I've made the modification to my reciever and it improves the sync considerably. It still does not have the sync capability of other radios. It is unfortunate that Icom is in denial over the fact that their sync implementation just sucks compared to what they could have done.

I feel that this is still the best value in shortwave recievers available today. Love mine!

372. Re: Second response from ICOM

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-08 12:18:48 UTC
From: pbigelow@us.ibm.com
Topic: 367 Message: 372

Hello,

Just thought I would try. If nothing was said to ICOM then
they would be entirely correct in stating that they have not
heard of any problems.

For me, the synchronous detector improves the readability of the
signal and keeps it readable during deep fades (those fades that
occur while the station is announcing its ID :-)) In any event,
if the sync does work as ICOM says it should (the reviews I had
read indicated that it did not work AT ALL) then it does have
benefit and may be suitable for my needs as is, without
modification.

So, has it been confirmed that the S-AM engages and works
on signals that fade to zero strength?

Other than the price of the optional filters, the R-75 does
appear to be a very, very nice receiver.

Best regards,

Paul Bigelow

Bravo Paul!!!!
Well done. I believe if there is a key to this problem (?) with Icom your solution is the best way to go.
Constructive criticism is often given but the constructive part usual gets lost before the message is received.
Far better to work with ICOM than to 'Keep telling them stuff'
Far better to offer a new possibility than to continue to tell them to fix something which in their eyes is not broken.
Maybe if we ask their opinionon on this mod and request thier assitance to see if works we will get farther than telling them we fixed your goof up
A tactful request to work with us on this possibilty may get us there.
(and as u see from my post i am not the person to request this as my forte danged sure aint electronics)
once again BRAVO Paul

Hi Paul: I too, cut my SWL teeth on a DX 160. The radio makes my ears squint. I still keep it for sentamental reasons and use it from time to time. I makes me appreciate almost anything else. Re very good audio. In the 1960's and 70's there seemed to be a push to make all radios sound like Zenith T O's . Then when the digital age came along decent audio was forgotten. I had a Panasonic 2900 which I worked to death. The SSB was lousy but the rest of the radio sounded good. Later I had a 2nd hand Yaesu frg 7700. It had pretty good audio when hooked up to an outboard speaker. I could never adapt to the harsher sounding , although much better performing Kenwood R-5000. Which is why I bought the Grundig 800. It is a good sounding rig. About two months back in the local Sally Ann store I came across the Holy Grail of SWL for $15.00. This was a Grundig Satellit 6000 that barely worked. The MW dial cord was snapped andn it will be a very difficult job to replace. The short wave bands barely worked until I cleaned up the band switches. And when I did that I heard the best audio on short wave that I have heard since I was 6 years old and played with the family console radio. When the current 800 advertises "That German sound" they are engaging in a little puffery. It is pale when heard beside the 6000. My advise is to find a big older rig for program listening and whatever suits your fancy for SSB. Hope this helps. Bob Mendria

well, i got my r75 yesterday, UPS Next Day from Universal.

like others on this list, i was immediately impressed by:

1) the size of the radio (seemed larger than i expected)
2) the bright display!

despite getting home late last night, i went ahead and set up a preliminary rig of an RF Systems Mini-Windom (indoors) and the Icom near my second story window.

it took me awhile to understand how to set the scan edges (even though i already own an R2!) and figure out that many of the settings apply to optional equipment (like the DSP - which did not come with my R75).

nevertheless, i stayed up fiddling with the radio until i couldn't keep my head up anymore!

while i still plan to set up a better longwire antenna outdoors, i am very pleased with the Mini-Windom.

and the R75 is great! for an "entry level" SW radio, this little radio is fantastic!

i'm sure with the coming weeks, i will discover some of the oft-described shortcomings with the S-AM feature and possibly want to upgrade my stock filters, but for now, the R75 is doing a sterling job for my listening interests!

381. the inevitable DSP question...again

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-11 02:48:41 UTC
From: Varela, Humberto J
Topic: 381 Message: 381

despite reading through the entire r75 list archive more than once, i am still having problems understanding the role of DSP in listening to SSB with the icr75.

right now, i'm tuned into some interesting conversation on 80 meter band, but with a very distinct and annoying "waterfall" sound in the background.

forgive my ignorance, but how would this annoyance best be resolved?

1) installation of and judicious use of the Icom DSP?
2) better antenna selection/configuration/placement?
3) better filter selection for the chosen band/listening habits?

as others have alluded to, the twin PBT function works well to eliminate unnecessary noise, but i am still left wondering if just a teeny bit more could be done to improve my SSB reception...

RE: Don't confuse "noise" with "interference". Bandwidth filters will reduce adjacent-station interference. They do little to eliminate certain types of noise, however. DSP in the R75 is an AUDIO stage process i.e., the detection has already taken place. Any adjacent splatter and interference will still be present, unless filtered out in the I-F stage ahead of the audio.

The DSP works well on SSB, especially with regard to the ANF notch filter function. If you are receiving AM heterodyne whistles, the ANF will sharply reduce these. This is useful for knocking-out CW interference when present on or near a phone QSO frequency.

To reduce general "trash" noise, I think the DSP is excellent. It will begin to affect a signal's intelligibility if set too high, especially with phone SSB signals. I use mine when the bands are noisy, otherwise I shut it off. I seldom set it higher than 4, usually 2 or 3 are best in my opinion.

I am also subject to AC 60-Hz interference at my site, particularly on hot summer days when the neighborhood homes are running air conditioners! I have a utility pole power transformer about 100 feet from my antenna tower, which is the worst culprit. The R-75,

fortunately, has one of the best NB (noise blanker) circuits I have used. Its only drawback is on strong signals (S10 or higher), where the NB contributes a raspy, "tearing-paper" sound to voice signals. If this occurs, I either back-down the RF gain or shut the blanker off.

I feel the DSP is worthwhile, but if I had to buy one outright, I'd find a used one or else spend my money on good filters first. I am using FL-257 for AM and FL-223 for SSB filtering.

Too bad you did not get the DSP free...but I would bet, if you asked around, you could get one cheaper than full price from somewhere.

Hi, Danny and all !

I am an earnest shortwave listener in Japan. I got my R75 last December.
Also I got some optional item, FL257, FL223, DSP unit, and RS-R75.
I usually connect outboard speaker, GROVE SP-200B. It's a good-sound maker!
I think this receiver is suited to ECSS and utility DXing.
My favorite DX-target are south east and central Asia and MW-DX □iNorth America and Pacific□j.
Unfortunately, there are few users of R75 in Japan. So I would like to give and get some information and know-how about this rx.

> like it?
>
> Danny

Oh, Danny! I have had HF-150E□inot HF-150!□j since Aug., 1998.
It's a top-notch audio quality performer , and suited to listen to international broadcasting and MW-DX.

RE 02/11/01: Welcome to the group! You will find LOTS of information about the R75, user tricks, mods, observations etc. So far, I am impressed with the membership in this group. There are many very dedicated and intelligent people at this site, it is by far the most enjoyable group I belong to. I only wish I had a digital camera so I could post a photo to the files, of my radio bench. If you want to learn, interact and share your experiences, this is DEFINITELY the place to be. Great people make great groups, and I am very happy to be in the presence of so many top-notch R75 users. You won't find it any better, elsewhere!

Hi
I thought it might be fun to compare memory layouts.
I use Mark fines software to set up my memories, and i have made a
few different plans up and swap them in a nd out as i need to.
I set up different memory plans for different types of listening.
Anyway i made a folder in files area called "memory schemes" an
popped a couple in there with descriptions.
feel free to look at my layouts, comment, suggest other "Hot
Frequencies" or post your own layout.

you know 100ch really aint enough.

have fun!

Hi Katagiri-san,

Welcome to the group!
I'm also living in Japan (I'm foreign student here). I'm in Okazaki - about 30 km south-east of Nagoya.
I would love to exchange some experience about R75 and DX-ing in Japan. My favourites are Europe and South America. Lots of urban noise below 9Mhz - how do you deal with it? I was thinking of purchasing MFJ-1026 noise cansellor. However the retailers here are selling it at about twice the price in the US. I have the schematic and will try to find the parts and asemble something similar.

Your house does not look like tipical japanese apartment - the ceiling seems pretty high. :-) Also the furniture ...

Best regards,

Rado

I hade spoke to a technician at Icom America many moons ago. He told me that he had tested the sync-AM in their shop and indicated that it performed according to specs -- my guess is they don't actually listen to the radios but merely look at the digital reading off their test equipment. His theory on the differences between the R75 sync detector and that of other brands is that the other brands employ filters in the sync detector circuit and the R75 does not. But I retorted that the R75 sync detector seemed to have no (positive) effect on selective fading. His response to this was that the R75's sync detector was designed to work in a specified range (he gave the range but I cannot remember what it is -- somthing like +- 3kHz). But to this day I have not noticed any benefit to using the sync detector (I have not done Rado's mod). In fact, the AM is almost useless to me on this radio. Fortunately, the USB side of things are decent and the radio is a good price considering. Nonetheless, I much prefer to listen to my AR7030+. Usually, the only time I listen to the R75 is when I have both the AR7030+ and the R75 on at the same time.

This is what I think - Icom never tests the radios in real world situations.
Only with test equipment (SSG, scope etc.). They will greatly benefit if
they hand the radio for beta-test to some users.

Best regards,

Rado

389. Where to get the Rado Sync Mod done?

To Michael et al:

Craig S. at Kiwa just finished doing his first R75 mods: to my Icom! I got it back today, Tuesday Feb. 13, so these are only my very first, preliminary impressions after listening to a couple of stations and bandscanning for a few minutes. I wanted to share this with you all right away. Tonite I will go back and check it out under more 'critical' conditions if I have time, for adjacent interference, S-AM/AGC performance, filter measurements, etc.

So far the most noticeable improvement (remember I only had the 75 for a few days, brand new, before sending it to Kiwa in January) was the substitution of the 15kHz filter with a 3.8kHz LFH2SK-W, the same Kiwa uses for the Sangean 909/R.S. DX-398 mod. Well, not really that way...READ:

We (Craig!) did the following to make the filter rotation 'logical':

1. Took out the 6k filter out and soldered in the 3.8k (450IF)
2. In the place of the existing 15k (wide) he put the 6k stock

Now I have: AM-W: 15 + 6; AM-M: 15 + 4; AM-N: 2.8 + 3.3
SAM-W: 15 + 6; SAM-M: 15 + 4; SAM-N: 2.8 + 4

For SSB I will use: W: 15 + 3.3; M: 2.8 + 3.3; N: 2.4 + 2.4

Notes:

The 3.3 b/w comes from the installed FL-257 (455k IF) filter
The 2.8 b/w comes from the installed FL-103 (9MHz IF) filter
The optional 455IF 3.3k CAN'T be used in synchronous AM mode

I can tell already that the 4k (OK, 3.8-3.9!) does a great job, and it sounds very well. I should add that an audio modification (whose details I don't know, ask Kiwa) was performed. It helps quite a bit in all modes and bandwidths tested today. Along with the DSP unit, it somewhat improves fidelity I 'feel', in general. I prefer to listen

more, probably over the next weekend, before saying anything else. You all know what the DSP option does, I won't talk about it, no change there.

Now...the S-AM actually works! In wide mode, with my filters and configuration, it roughly locks 3k up and 3 down; about 2k with the intermediate b/w, 1.5k with the narrow. It now 'howls' for, I'd say, barely one second, but it seems to hold frequency quite well. I really need more time to tell. I tried everything with a weak station (RFI on 15300kHz) and a strong religious (?!) on 15390, to contrast them.

I don't know if Craig did anything different than what Rado had already 'discovered'. I will ask him lately what exact parts he used, which values, etc. You would have to ask him if you want to know, I'm not to reveal 'everything', I can't. He's been sick for a week, he is not feeling too well yet, he barely could talk this afternoon. So I didn't want to ask him 'the works'. :-)

He told me to tell you to wait and watch the Kiwa site for news on when he will actually be ready to take on more R75s if you would be interested in the mods. He doesn't have a price set yet, he's backlogged with work, it'll take him a few days, a couple of weeks maybe (?!).

For AGC use, in the ½ hour I 'tested' the R75 this afternoon, I noticed that using Fast for looking for signals worked a bit better, Normal (Slow?!) when the station has been found and you will listen to a program. Every ear is different, that's up to everyone personally I guess, most of the time, according to my experience with previous communications receivers. I will try both AGC settings more with SSB in the upcoming days to see what works better/best for me with that mode.

Craig forgot to check out the attenuation mod, he didn't do it, so when I have time to open the unit, if I feel I need it (I don't think so, AM listening is only secondary for me), I will handle that myself, it's easy. I will first test by temporary short-circuiting the two tiny half-moon pads, then bridging them if I like what I hear. No hurry whatsoever on that.

Bear with me, I'm very busy and most probably won't be able to reply individually if you write directly to me with questions. I would prefer that you ask them here in the e-group so everybody benefits from the answer(s). I will try to check out the site once a day if I can.

So Rado...any questions?! If you get 'technical', I will have to refer you to Kiwa, watch out. I'm 'theoretically weak', I just listen to shortwave, since the 70s by the way. By way of courtesy I'm emailing this comments directly to him in Japan only.

I'm very happy with the way my 'new' R75 handles and behaves now and so far. By Sunday or Monday I might come back here and say something different, check me out!

Best regards to all in the group

A few last-second additions:

1. Kiwa doesn't have a price set yet, it'll be posted on the site
2. Outer (455k) PBT knob works with 4k filter in S-AM mode, nice!
3. Kiwa's site URL: www.kiwa.com
4. This is what it shows about 'our' radio there right now:

"ATTENTION Icom R-75 receiver owners!!

Kiwa Electronics will soon have receiver
upgrade enhancements for the R-75!"

My turn....

Sitting here listening to BBC on 6.175 (or 6175 to the khz purists) and have a fair amount of fading. Signal levels are S9 to S9+20. I cannot tell any difference between AM and S-AM. Are these signal levels too high?

OK, turned off the Preamps, S3 to S7 peaks, occasionally dropping to S1. Switching the Sync off and on seems to do nothing. Tuning off freq with S-AM on I don't see a "lock" point...

Further, ATT on, no signal on the meter, S-AM blinks, no difference in AM or S-AM. I can barely hear BBC even though there is no signal indicated on the meter.

So, what exactly does Icom think S-AM mode will do? I wish someone from Icom would explain what they think it does and then Rado explain what it should do....(to Icom, not us...)

My 2 cents worth...

Nick
WB4SQI

OBTW, I guess my original post about growing up without synchronus AM still holds true. If you never had it, maybe you don't know what you are missing....

Hi Jem,

I'm using the memories on my R75 for temporary storage only.
My DX sessions are like this:
- GNPB software on my notebook for ILG database.
- TRGpro (PalmOS) for logging - I have a database in ThinkDB.
- RecAll soft for recording in MP3

I first clear all memories and then write each catch in a channel. After some time I go back to the previous catches to check what's up (if there is some improvement in the SINPO).
Does somebody know a way to clear all memories without resetting the R75 (and losing filter settings etc.)?

Best regards,

Rado

> the substitution of the 15kHz filter with a 3.8kHz LFH2SK-W, the same
> Kiwa uses for the Sangean 909/R.S. DX-398 mod. Well, not really that
> way...READ:

Yes, the filter substitution gives a lot. I constantly use my 4 kHz filter. The 6KHz one is used only for strong stations without "neighbors".

> 1. Took out the 6k filter out and soldered in the 3.8k (450IF)
> 2. In the place of the existing 15k (wide) he put the 6k stock

This was my initial intention when I went changing the filter. But after the bitter experience with de-soldering the 15kHz filter I decided to stop there. Now I have solder-sucking syringe. It makes the life much easier. We learn from our mistakes :-). Actually what Craig has done makes only for more logical filter setup (15 to be the wider).

> Now I have: AM-W: 15 + 6; AM-M: 15 + 4; AM-N: 2.8 + 3.3
> SAM-W: 15 + 6; SAM-M: 15 + 4; SAM-N: 2.8 + 4

Same here but with 2.4 instead of 2.8 in the 9MHz (don't have FL-103 ... should have bought it instead of FL-257).

> For SSB I will use: W: 15 + 3.3; M: 2.8 + 3.3; N: 2.4 + 2.4

Again the same here.

> For AGC use, in the ? hour I 'tested' the R75 this afternoon, I

Before the mod there is no much difference between fast/slow AGC in AM/S-AM mode. You should see a big improvement with rapidly oscillating stations. Generally slow AGC is used when listening and fast when tuning.

> So Rado...any questions?! If you get 'technical', I will have to
> refer you to Kiwa, watch out. I'm 'theoretically weak', I just listen

> to shortwave, since the 70s by the way. By way of courtesy I'm
> emailing this comments directly to him in Japan only.

No questions. I'm sure Craig has done a great job. We could not expect him to reveal the full information as this is what he does for a living. There are certainly some additional improvements in the audio chain. Kiwa has audio
mods for many receivers so they have experience with this.
Well, I started about 2 years ago with VHF/UHF monitoring. About a year ago I bought my first SW radio - SONY ICF-SW07. I quickly shifted from VHF/UHF to SW. Shortwave is much more exciting for me.

> I'm very happy with the way my 'new' R75 handles and behaves now and
> so far. By Sunday or Monday I might come back here and say something
> different, check me out!

Waiting for more impressions :-).

> 2. Outer (455k) PBT knob works with 4k filter in S-AM mode, nice!

Outer? The outer in for 9Mhz IF.

Best regards,

Rado

Hi Nick,

I think we should not get angry at Icom. After all they are providing a great receiver at unbeatable price. There are some shortcomings but Icom's main business is transceivers. I don't think they make a lot of profit from R75 - it just completes their product line. No profit - no attention to customer complaints (the engineers are debugging the latest transceiver or developing a new one). If they really want to take over the shortwave receiver market - they can do it very easy. But I think this market is very small compared to the amateur market so they have no interests there. R75 is intended as a backup receiver for the amateurs - it has great SSB. The problem is with the marketing department which puts S-AM as one of the major advantages of R75 in their advertisements. If there was no S-AM at all I think the reviews would have rated R75 even higher (no something which does not work). Check the comments on the Palstar R30 (the price is the same as R75).

I'm grateful to Icom that they provide such radio which only needs some small modifications to make it work as it should. Construction quality, ergonomics etc. - top notch.

I also want to make Icom listen and provide some improvements but as a company (japanese) the profit is at first place for them (they have to survive). I sent my mod info to Icom America about a month ago and was told that it will be forwarded as appropriate.

Icom will react only in the case if a problem with a product like R75 is so bad that it will spoil the whole image of the company. And R75 is not so bad. There are many similar problems in their transceivers but the people still buy them because the plus-es are more than the minus-es.

This is what I think.

Rado

Hello,

According to ICOM, the signal level is supposed to drop to zero for the S-AM to be engaged. Who knows what zero means? Zero as in NO signal (including or excluding background interference?). If they truly believe zero signal, the only way for that to happen would be to disconnect the antenna.

Awaiting response from ICOM R&D...

Best regards,

Paul Bigelow

My turn....

Sitting here listening to BBC on 6.175 (or 6175 to the khz purists) and have a fair amount of fading. Signal levels are S9 to S9+20. I cannot tell any difference between AM and S-AM. Are these signal levels too high?

OK, turned off the Preamps, S3 to S7 peaks, occasionally dropping to S1. Switching the Sync off and on seems to do nothing. Tuning off freq with S-AM on I don't see a "lock" point...

Further, ATT on, no signal on the meter, S-AM blinks, no difference in AM or S-AM. I can barely hear BBC even though there is no signal indicated on the meter.

So, what exactly does Icom think S-AM mode will do? I wish someone from Icom would explain what they think it does and then Rado explain what it should do....(to Icom, not us...)

My 2 cents worth...

Nick
WB4SQI

OBTW, I guess my original post about growing up without synchronus AM still holds true. If you never had it, maybe you don't know what you are missing....

Sounds very interesting. Glad to hear someone will provide mods for those that don't feel they can (or want to) do it themselves. I've heard great things about Kiwa.

Have you tried using FM yet? I thought that FM needed the 15kHz filter to operate. Am I wrong? To be honest, I havn't used FM much myself, so if it was a tradeoff for better filters, maybe it is a good thing.

I'm a little confused about all of the things that Kiwa modified. When you get a chance, could you itemize them for us?

Have fun,

Keith

Rado:

Have you tried Fineware's control program for the R75? It lets you set up seperate files each with a different set of frequencies and settings. It's pretty cool. I don't use it much because I run Linux. I have to reboot into Winblows to fire it up.

I don't know of a way to clear memories.

I too use my Palm V with ThinkDB for logging! I picked up one of those fold-up keyboards so I can type data in quickly. It works very well.

Good listening!

Keith

COMMENT: Depending upon your use of the R75, the 15-KHz filters may be somewhat expendable. They are primarily intended for FM, of course and I DO use my FM quite extensively for 28-54 MHz amateur bands and lo-band FM public frequencies reception. So in my case at least, I am unwilling to sacrifice 15 KHz filter for that reason.

What I would like to do, is substitute the 9Mhz stock 15K filter, with a 4-4.5 KHz one. I am having trouble finding a suitable filter for this stage. I do not want to fool with the nice 455 filter selection I now have (15, 6, 3.3, 2.4). However, the combinations I am limited to for S-AM (which I do not use that much, anyway)would be better served if I could find a 9MHz replacement.

I am an experienced service technician, so I generally perform my own mods. I am interested to find out if Kiwa makes replacements for the 9MHz section, or if anyone here knows another vendor, I'd be interested.

Well Paul and other R75er's,

I had BBC at zero signal level last night and there was no difference between AM and S-AM. I could hear BBC, although not well. Having S-AM on did nothing for the receive, that my humble ears could discern.

Again, I ask the question: Exactly what is the S-AM "supposed" to accomplish?

Rado,

Please don't get me wrong, I am not angry at Icom, they have manufactured a great product in the R-75.

I just wish they would explain exactly what they believe the S-AM mode does on this receiver. In an unmodified condition, I can't find that it does anything.

However, just because it doesn't do anything for me is certainly not enough reason to get rid of the receiver. the R75 has caused me to look at the Icom 718 transceiver, which looks identical to the R75 except for having a transmitter.

I like the package, the features, and the price ($ under 700? here). It is a good looking radio, and if it works as well as the R75 does then I may own one in the future.

Having started life with Collins (in the US Air Force) and living with Heathkit, then Kenwood equipment later on I can appreciate the aspects of owning the R75. I find it more pleasant to listen to than my R5000. Now, if I could only get Grundig sound from my R75, what a nice radio it would be then.

OBTW, sync AM in the Grundig Sat 700 works only fair, but the superior Grundig audio makes up for other shortcomings.

again, my 2 cents worth.

RE: A somewhat better result, but still leaves the narrow "too"
narrow. It is, unfortunately, unavoidable though.

> > For SSB I will use: W: 15 + 3.3; M: 2.8 + 3.3; N: 2.4 + 2.4
RE: Here is a good combination. Nice balance of bandwidths especially
for ECSS tuning. I find the combination of W: 15/3.3, M: 2.4/2.4,
and N: 1.9/2.4 more useful for my own needs. This is because, unlike
many users in this group, I use my R75 about 70% of the time for SSB
communications. The 1.9K filter is exceptionally good for crowded
amateur radio bands, where separations are on the order of 2KHz apart
(or less).

FM is working well with the 6 kHz filter. I don't believe somebody is
actually using 15 kHz wide FM modulation on their transceivers.

Best regards,

Rado

DTE, or DCE?

Has anyone tried to use the specification in the manual to right a control program?

Since I tend to like UNIX workstations, I'm thinking about writing one for my Sparc.

Thanks.

> Why not simply replace the 15K directly with the new one? Saves
> stress and heat shock on the 6K, to boot!

I'm picky. I wanted the 6 in the Wide position (ex-15), the 4 in the
intermediate (ex-6), then leave well alone the 2.4 in the narrow. My
call. Craig handled it well. Hope the 6k filter can too!

> > > Now I have: AM-W: 15 + 6; AM-M: 15 + 4; AM-N: 2.8 + 3.3

Thanks, Dan. I know the 2.8/3.3 is TOO narrow. I went back to the R75
and tested 15/3.3 instead. It's quite close to the 15/3.9 in there,
but you're right, it's more USEABLE. I think I will leave like that.
Switching the frontal 15k (9MHz) off doesn't do anything, so...

That's what I want it for MAINLY. Personal needs, I guess. I'm much
more a SWLer than a utilities listener. Hence my decision.

> I find the combination of W: 15/3.3, M: 2.4/2.4,

To be exact, I had the FL-223 (1.9/9MHz) ordered from Universal
first, then I'm happy Gert Nilsson made me change my mind. I feel
fine with the FL-103 (2.8/9MHz).

>

> tradeoff for better filters, maybe it is a good thing.

I was just listening to.....somebody.....on 44.48 a few minutes ago.
The 6 it's 'wide enough', barely I would add. Again, my PRIORITY, 95%
why I bought the R75, is program listening. FM is only secondary to

me. But the answer is, yes, it still works, seriously. I noticed the DSP --both functions-- helped quite a bit 'clarify' reception, great!

> COMMENT: Depending upon your use of the R75, the 15-KHz filters
> maybe somewhat expendable. They are primarily intended for FM,
> of course and I DO use my FM quite extensively for 28-54 MHz

> So in my case atleast, I am unwilling to sacrifice 15 KHz filter
> for that reason.

And I see and respect that too. Everyone to his thing or aspect of the hobby. Fair and democratic.

What I would like to do, is substitute the 9Mhz stock 15K filter, with a 4-4.5 KHz one. I am having trouble finding a suitable filter for this stage. I do not want to fool with the nice 455 filter selection I now have (15, 6, 3.3, 2.4). However, the combinations I am limited to for S-AM (which I do not use that much, anyway)would be better served if I could find a 9MHz replacement.

I see your point. Good luck finding that replacement. It should 'exist'.

As to the AM bandwidths available, I'm VERY happy with mine now:

6, 4, 3.3 & 2.4

> I'm a little confused about all of the things that Kiwa modified.
> When you get a chance, could you itemize them for us?

Craig S. didn't send down the technical details, and I already stated here I'm not, like some of you, and copying Danny's expression, "an experienced service technician".

Itemizing, Kiwa...

changed the filter(s)
did the AGC/S-AM mods
performed a simple audio enhancement (?!) [call Kiwa]
forgot to check/do the MW band 'less' attenuation mod
had my radio for almost a month
charged me for filter, parts, shipping mostly
didn't charge me for service, my 75 was the 'guinea-pig'

Did I miss something, Craig?!

That's all what I know or can tell you.

On the other hand, I won't say: Call him! Nor the opposite. Up to you.

Thanks, gang.

411. Old trick - sligthly detuning from frequency

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-15 08:33:31 UTC
From: jjga@usa.net
Topic: 411 Message: 411

As I did so many times before with my IC-R72 (recently sold), sometimes when I'm listening to world band radio programs, instead of switching to SSB to ECSS, I use the narrower filters and sligthtly detune from the center frequency (remember, in AM mode you get both the sideband plus the carrier) to neatly improve the audio frequency/fidelity. TRY IT if you haven't done it, you'll hear the 'nice' difference.

With the FL-257 what works best for me is between 500-750Hz to either side. Check it out and tell me if you agree.

With the new 4k, I feel confortable going up to a full kilohertz either up or down the 'real' frequency. You won't be able to see that...yet, unless you install this filter. Rado should be able to tell with his CFWS450IT.

Switching to S-AM adds proportion, depth, better sound yet. I'm not making this up, it's real, I can hear it. And I mean with the FL-257 itself, besides the 4k one. Rado, please, yes or no?! Our super-optional filters are different, but not by that much, pal.

Dedicated utility listeners might detract from this relatively cumbersome (but effective!) AM reception technique. When things get tough around the bands, using a narrower filter and detuning away from any potential present interference also makes wonders. Even without interference or natural or man-made noises, just for the enhancement of the signal quality, it's worth it sometimes.

Now go try it if you have the 3.3k and see (hear!) for yourself! ;-)

I'm a teacher and I'm off work and gone from Friday to late Monday (President's birthdays!). I will check back here for any comments and questions on this or the Kiwa mods on Tuesday afternoon, after work, most likely.

Best regards and reception to all,

J a s o n

Topic: 367 Message: 413

Hello,

This is what I have been trying to do:
1. Approach ICOM with issue
2. ICOM states their position as to how the S-AM is supposed to operate
3. Verify ICOM's claim and review the owner's manual.

In my previous updates, the ALL CAPS responses are ICOM's support
own works.

If S-AM works as claimed then ICOM is not at fault and we may be on
our own.

If the S-AM does not work as ICOM claims or how the documentation
states how it is supposed to work AND WE CAN PROVE IT, then we have
a very powerful case to present to ICOM.

That way they cannot claim we do not know what we are talking about
or that the radio is "entry level" or S-AM is to work for a narrowly
defined
set of parameters, etc.

Instead, we can claim that is is not working as documented or
as ICOM support claims. ICOM would have to respond at that point.
Perhaps if multiple owners sent one email signed by all then
it might then have some weight.

The trick here is to give ICOM's first line of defense (e-mail and
telephone) a chance to resolve the issue. That's what they're
paid to do. If they are unable to resolve the issue or seem
unwilling to cooperate, it is time to escalate to advanced support
or their management.

Best regards,

Paul Bigelow

Rado,

Please don't get me wrong, I am not angry at Icom, they have manufactured a great product in the R-75.

I just wish they would explain exactly what they believe the S-AM mode does on this receiver. In an unmodified condition, I can't find that it does anything.

However, just because it doesn't do anything for me is certainly not enough reason to get rid of the receiver. the R75 has caused me to look at the Icom 718 transceiver, which looks identical to the R75 except for having a transmitter.

I like the package, the features, and the price ($ under 700? here). It is a good looking radio, and if it works as well as the R75 does then I may own one in the future.

Having started life with Collins (in the US Air Force) and living with Heathkit, then Kenwood equipment later on I can appreciate the aspects of owning the R75. I find it more pleasant to listen to than my R5000. Now, if I could only get Grundig sound from my R75, what a nice radio it would be then.

OBTW, sync AM in the Grundig Sat 700 works only fair, but the superior Grundig audio makes up for other shortcomings.

again, my 2 cents worth.

Nick

Hi Derrick and all....

Before christmas I emailed the group regarding getting a homebrew programme up and running. Some interest was expressed and basically it was decided that a linux version would be written. I was going to spearhead the activity. I couldn't start until Mid-January and now I'm in the middle of 2 computers, both in pieces. When I finally get one together with linux functioning on it I was planning to start work on it again.

I did some initial work and discovered that the numbers being sent back and forth from the unit didn't match those in the manual, but the basic format was right. I have not been able to "control" the unit from a linux environment as yet. Probably I haven't figured out all the finer details yet, but given time I'm sure it is doable. As I said, I have stopped the work because I'm redesigning my hardware (my girlfriend want's a computer so I'm building her one... big mistake) Anyway, soon I hope to get back to it.

I'd be happy to read any ideas you have. I had plans for designing a GUI in GTK (I can do basic programming in GTK) but have little experience with SUN/Solaris/Sparc type programming. Probably the most important thing would be to get a command line program up and running first anyway. Email me back and we can discuss it, and if anyone else on the list is interested, email me too.

Scott

Hi, I am new to the group but have been monitoring its contents for a week or so.
I am about to buy my first 'serious' short wave receiver, and have narrowed my choice down to two, namely the R75 and the AOR7030.
At present I am 70-30 in favour of the Icom, so if I buy one - is there anything specific I should look for?
For information, I live in the UK (West Yorkshire, aka ee-bah-gum land)so would anyone care to recommend a reputable outlet?
Thanks,
Mike Brown

RE: Yes on both counts. My R75 has a 20-Hz detuning from dead-cold start, which disappears after about 20 minutes. This remains rock stable from then on, for many hours' use. 20 Hz out of sixty million Hz is among the best I have ever seen, and better than much of the test equipment I have worked with. I still recall the days when the other techs and I would arrive for work around 7:30 am, go to our benches and switch-on the equipment, then sit for about a half-hour with our coffee until the store opened at 8.

Usually by 8:15, the calibrated gear would be "zeroed", and the uncalibrated gear would be checked against our standard. The R75 warms up to zero in less time than that process took, and it lacks a TCXO! This is why I do not recommend the expensive TCXO for most uses of the R75 (unless you are using it outdoors, etc.).

My
> call.

FROM DANNY 02/15/01: It should make no difference! YOU choose the
filter by rolling the tuning knob...the R75 doesn't "care" what
position the filter is in, as long as it's not in the "Opt" slot.
YOU decide W/Nor/Nar from the selected option menu, in which you can
select anything, in any order except the S-AM. So it should not
matter, other than doing twice the work. That was my only reason for
```

asking.

RE: Danny 02/15/01
Selecting the 9MHz filter to "off" will defeat the 455MHz filters in
some modes. I think this is silly, just as I think it was silly to
put two 15K and two 2.4K stock filters in the R75, to begin with. I
explained the apparent lack of consideration from an engineering
standpoint, to the Icom representative yesterday, of duplicating both
I-F stages with the same filter bandwidths. The immediate response
to this, was that ICOM has NO other sources for these stock filters.
This is also why I could not replace the 15K in the 9MHz section,
which would solve ALL the problems, without resorting to a Kiwa
powered filter that does not match exactly. I disagree, I think they
could have found SOMEONE, (lol)...

RE: Be sure you ask about the 7030 in its Plus (+) version, if you decide that way (benefits to doing this)! Also, the AR-7030 is in a slightly different league than the R75. It is generally held to a higher place in the food chain, and its price reflects this. It has excellent specifications, a tunable notch filter, and synchronous detection that allows either sideband or BOTH sidebands to be used. At least one major publication's review gives the 7030 bad marks for its difficult logic/operating menu. It is also said to suffer from some phase noise and lacks (like many receivers) a decent 4KHz filter, although one is available as a user-added option.

At about 100-300 pounds greater cost than the R75, it should have more going for it than the Icom, at least on paper.

Well, I think I have about run out of ideas, comments and viewpoints to post to the group. I came into this e-group already a huge fan of the R75, then picked up some very useful and enriching information to make me appreciate the R75 even more. What else is there for me here?

With the many technical "missions" accomplished by the group, the successful bell-ringing of ICOM technicians, the introduction of an apparent solution to the AM sync and filter option issues and the general enlightenment of all who have come to understand (or be confused by) the many great postings to the group, it is time to move on for me.

I hope you all grow into, and enjoy, the monitoring hobby with your prized R75 receivers, using all the capabilities it has at your disposal.

It has been my pleasure to meet many of you, and thanks for the e-mails and ideas you have given to the group. I hope you all enjoy your receivers as much as I have, and will continue to for many years.

I will continue to drop by the site from time to time, but I am ending my active participation on a regular basis, as of tomorrow.

73 to all!

Danny

I have both receivers and the 7030 (mine is not the 7030+) is in a league above the R75, not just on paper. It is, of course, considerably more expensive than the R75, which I believe that I will sell in the near future.

I had similar problems when developing Smart Icom, which was solely done "in the blind". All I had was a manual and testing software that Tom Sundstrom used (he had the radio). The test software had a pseudo- "terminal display" that showed what was getting sent, and what was getting returned from the radio. All non-ASCII characters were displayed as numbers (i.e., $FF was shown as "<255>"). This way Tom could relay to me what was going on via IRC and/or ICQ.

...But that was last year.

While I had the FL-257 in the radio, detuning (in AM mode) did restore those highs enough to make the listening enjoyable. Otherwise, the sound was too dark.

RE: The twin PBT controls work well for this, too. It does little
to restore higher audio frequencies, but will work on nasty adjacent-
station interference without detuning.

426. [icomr75] S-meter calibration

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-16 08:06:36 UTC
From: aunumero13@aol.com
Topic: 426 Message: 426

Hi all !

It seems the S-meter is not very accurate on this RIG. Compared to others sets I have, it indicates 5-6 points less. Using the preamp1 the value seems to be more accurate but it also brings unwanted noise sometimes.
How to calibrate it ?
Could someone tell exactly (with simple words and details of the location) how to put it right.

Many thanks,
Pat in France.

427. Mystery Filters

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-16 10:55:13 UTC
From: jemmex@yahoo.com
Topic: 427 Message: 427

HI
I have a question that perhaps one of the gurus here could answer
(you listening Rado etc...)
I have come across a few icom ann murata filters and was wondering if
they were any use to the r75.
If someone knows what the specs (bandwidth etc) on them and if they
can be fitted to the r75..if there is any point in it?

thanks

they are
ICOM-filter FL-40
ICOM Filter FL-30

Murata filter CFJ455k (seems to be marked S 5)

looked onthe net and at icomamericas web page could find nothing
good dxing and swling

Speaking of the S meter, mine seems to go up to a certain level and the two bars behind the highest one are dim or intermittent regardless of what the signal level is. Jim

RE: The s-meter is calibrated to lab signals furnished by a precise signal generator, under specific connection and test conditions. The R75 is reported to have some inaccuracy below S-9. I have found, however that the signals above s-9 are exceptionally accurate.

The type of antenna and total signal you are feeding into the R75 is important. It is also important which terminal you are using, ant1 or ant2. With a 60' sloper and a triband antenna available to me here, I get pretty good results.

One thing got my attention...you report that when you use the preamp-1 you bring in more noise. This may be an indication that your antenna is not delivering enough signal. Also, is your R75 GROUNDED? If it is not securely grounded, you may experience some signal loss, especially if using a hi-Z antenna at the push-terminal inputs.

I own several receivers here, and some have very "heavy" s-meters. They will give a weak signal an S-9 indication, and strong signals will "bury" the scale. If I had to choose between the two, I would rather have the "low" s-meter.

Check your antenna and ground the receiver well. You should not be pulling much extra noise on preamp-1, unless the signal is not strong at the input terminals.

:-)

JIM--have you set the submenu for peak-hold function? It is the menu heading "P HoLD", between "BP LIM" and "SCN Rs". In this function, the meter seems to "emphasize" the peak bargraph indicators at the end, while the rest drop back a bit, in the way you have described. When I select my P-HoLD to "off", this does not happen. I think this is intentional, to make the peak easier to read during its brief hold.

Thanks!

Danny

Try running your RF gain knob up to see if it is the LCD or a
receiver problem. I did this on mine by rotating the squelch
knob fully clockwise.

My meter will deflect up to the area just below the "0" in the
"60db"of the meter. I have no LCD bars indicated in the area to
the right of that (below the db in "60dB".)

Also there is a procedure to calibrate the "S" meter in the "Files"
area of this group under "Information", "Alignment Procedure",
"Section 4-4".

"CAUTION" these adjustments must be made with the proper
signal generator. Otherwise it is a guess at the signal level that
you are adjusting it by.

It appears that it is calibrated at 3 points.....

"0" Signal Level (no Signal)
"S-9" Signal Level generator at 35uV's or 31 dBu
and "Full Scale 60dB" with the generator at 28 mV's or 89 dBu

If you have a signal generator this should be no problem to
calibrate. Personally, I don't have access to one.

You could calibrate your meter to a similar reading of another
radio that you use. That way you could easily compare signals
between the two.

I compared the S-9 readings for WWV on 15 MHz between my R75
R8500 HF Receiver, and IC-746 Amateur HF Transceiver.
The R75 read identical to the 746(both preamps on) .
But the R8500 read several dB below the other two (this radio is
known for its stingy "S" meter.)

These reading are relative and should only be used for comparing
signals on the same radio anyhow. For me I am content with the
readings on them.

For the tweaker out there , ICOM makes it easy to adjust from the
front panel menu. You just have to enter the adjustment mode. This
requires a terminator to be attached to the remote connector on
the rear panel and pressing the "CLOCK" and "ANT/SET" buttons
simultaneously and powering up the radio to enter this mode.

I could not get mine to enter this adj. mode without the terminator it calls for.

Not too sure about the terminator configuration called for in 4-4 of the Set Mode Adjustment ? Maybe a shorted 1/8" plug ?

432. Kiwa Mods Posted As Available At Their Site!!!

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-18 20:22:28 UTC
From: jjga@usa.net
Topic: 432 Message: 432

I think it had to be up to me to let you know, guys.

I personally believe the mods are very worth it if you are planning on keeping that radio. With the addition of filters, the R75 becomes a VERY NICE LITTLE RECEIVER. I see no solid competition at its price range, maybe even after adding filters and paying for the mods. It's unfortunately that right now Icom is not offering anymore the DSP free when you buy one. That even things up a bit with the other models now readily available.

For somebody buying a new unit, maybe a JRC-545, AOR-7030+, Drake R8B, Palstar R30, or even a Grundig S-800, might make more sense. But if you already have the R75, I would recommend you go for the 'enhancements' if you cannot or don't want to perform them yourselves...like me.

This is what you will find if you visit Kiwa's site (www.kiwa.com):

"Icom R75 Performance Upgrades

The following Upgrades is avaliable by sending the R75 to Kiwa Electronics.

450 kHz Filter Upgrade
The 450 kHz filters come stock with two bandwidths; 15 kHz and 6 kHz. The 15 kHz filter is used for both Synchronous AM and FM reception. We remove both the 15 kHz and 6 kHz filters. The 6 kHz filter is installed in the 15 kHz slot. (Please note:this mod will affect FM performance) A 3.8 kHz filter is installed in the 6 kHz slot. The improved selectivity will enhance synchronous AM reception under difficult signal conditions.
(This is the same filter we supply for the ATS909 and CC Radio.)

450 kHz Filter Upgrade $40.00
Filter installation and reassignment $50.00

Synchronous Detector Upgrade
Kiwa provides two major upgrades to the Synchronous Detector. Together they provide enhanced performance where the PLL stays "locked" under the most difficult signal conditions.The first upgrade is best described as a "dual speed control voltage". The control voltage for the PLL filter is tuned within an optimum window that is determined by signal conditions.The response is slow to maintain a "centered" condition. A second circuit provides the control accuracy to react to fast flutter fading and noisey conditions. These two circuits provide a dual speed control for the PLL.

The second major upgrade is to the Synchronous AM AGC. The dual speed technique is used again to first center the AGC but still allow for quick short changes in AGC characteristics as required by signal conditions. All components are encpsulated in a plastic shell and mounted to a side chassis wall.

Synchronous Detector Upgrade $45.00

Audio Upgrade
Key components to to audio power amplifier are replaced to enhance clarity and definition.

Audio Upgrade $35.00"

From: jjga@usa.net
Topic: 433 Message: 433

In case you decide to go for the mods,
this is what I find works best FOR ME:

AM/W 15.0k + 6.0k

AM 15.0k + 4.0k

AM/N 15.0k + 3.3k

S-AM/W 15.0k + 6.0k

S-AM 15.0k + 4.0k

S-AM/N 2.8k + 4.0k

SSB/W 15.0k + 3.3k

SSB 2.8k + 3.3k

SSB/N 2.4k + 2.4k

4.0 (LFH2SK-W, 3.8k/455IF) - nominal 3.8k/450k b/w
3.3 (FL-257, 3.3k/455IF)
2.8 (FL-103, 2.8k/9MHzIF)
All other filters 'stock'

Try these dealers......I found them at the ICOM website:
http://icomamerica.com/dealers/fl.html

It appears that Ft Lauderdale has several dealers and is
not located too far from Miami. Also there is one in Miami
but it is for export only. They might be good to deal with.
I am only familiar with AES (Amateur Electronic Supply)
and I have never had a problem ordering things from them.

Not living in that area I am not too sure how far or difficult
of a drive that would involve going up to Ft Lauderdale.

You could possibly get a radio shipped from AES, up in
Orlando, to the place that you are staying at.

Give them a call and see. They have a toll free # listed.

Hope you have a safe and enjoyable trip to Florida.....

Date: 2001-02-19 02:32:24 UTC
From: Mark Veldhuis
Topic: 437 Message: 437

Hello,

I just noticed that there's a diffrence between S-meter readings in LSB and USB.
I am listening to Cuba on 6 mHz. In LSB, the reading is S9+20, against S9+10 in USB.
Radio CBN Anhanguara on 4915 is about S7 in LSB, while in USB it's around S5.
This doesn't seem like normal to me. Anyone experience the same on his/her (?) R75?

Same here. Cuba @ 6 mHz seems about 20db lower on LSB. Curious. Must be
their transmission. BBC on 6175 seems about even. Any comments?

Keith

I have ho difference between USB and LSB. If you are using 2,1 kHz selectivity perhaps the carrier is on the slope of the filters and just 100 Hz means a lot if the filters are not centered. Check the PBT settings!

I don't think it's their transmission, because it happens on all stations I
tune to.

PBT controls are at center position, so that's not the problem. Guess I need to take the radio to the shop to have them look after it. LSB and USB also sound slightly different, so I guess something is not properly alligned.

I've noticed the same difference between LSB and USB, using narrow filter setup (in this case 2,8/2,4).
Also the audio coloration is slightlty different (a higher pitch on USB)
Adjusting the PBT a bit will clear this out.
Until now, I've suspected bad alignment of the PBT circuitry, however I'm not sure...

From: Nick Marsh
Topic: 437 Message: 443

I see this also and believe it to be related to centering the signal in the passband. Be sure that the PBT knobs are centered before trying this test, pick a good strong signal like WWV and see if the signal strength is different between sidebands.

My R75 sounds as if one of the sidebands is shifted slightly in the bandpass, slightly altering the audio characteristics and signal strength. Not much, only slightly...

It could be the filter who is wrong. I also had som difference in pitch between USB/LSB with the original filter.
So I sent a soundfile to my dealer and they said that it was a little too much difference so I got a new filter.
It is not perfect now but it is much better than before.

Hello,

No doubt variations in the slope of the filter are causing
this issue. Collins makes special filters for USB and LSB.

Best regards,

Paul Bigelow

447. USB LSB differences

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-02-23 11:00:47 UTC
From: jemmex@yahoo.com
Topic: 447 Message: 447

Yep like everyone else, I find a big difference 'tween the two.

My findings were based ona series of tests usingan LW beacon WWV...VNG,a 27mhz Am CB txer and a strong clear channel MW broadcaster.
Basically an signal which is S7 on AM will be S2 or less on USB and S6 on USB. s6 or less in am will be no Spoints iin USB and noisy. Also USB WWV pips seemed higher pitched (one musical note)on USB then LSB. Another point, LSB sounds more muffled and USB more bright.and the voice overs on WWV are hard to hear (in fact can be easily missed) on LSB.

Quite some variation. Seems not to matter where I am tuned tested from 300khz to 27MHz.

However if i tune the larger/outer PBT knob (which filter is that?) the signal stregnth variation can be nulled.
IF i tune the outer ring to about "10:30am" in LSB and "1:30pm" in USB the sig stregnth will be as high as on AM adn the muffled effect of LSb disappears. (still sounds a note out tho, so i supect alignment of lacal oscillators or somesuch.)

As to the S meter, I have yet to see the S meter show over 40dB, and that inclued local Hams (i even monitored my own Tx) and power housed. If it wasnt for the RF gain, i wouuld swear it didnt go past 40db.

But i still love this rig :)
73 and good Dx
de Jem
VK2JEM

PS did anyone see my post about those icom filters, i still havent found any specs on them....

Now that you have 15 + 4 for AM narrow, is there any point to listening to AM in SSB mode with 2.8 + 3.3? I find the 2.8 + 3.3 useless for true SSB. And given, you have the 15 + 4 for narrow AM, the seemingly small difference (to my ear) of listening to AM in SSB mode with 2.8 + 3.3 versus 2.4 + 2.4 seems hardly worth it. If it's a hard to copy single where the SSB mode is required, the sound quality loss (which seems small) in the 2.4 + 2.4 mode (versus 2.8 + 3.3) won't really matter.

I had the 2.8 and 3.3 filters but since acquiring them have moved the 3.3 into my AR7030+ -- now I only have the 2.8 (9 MHz IF). I have recently sent my R75 off to KIWA for the mods and am now wondering if I should get another 3.3 kHz filter or skip it and go for two 500 Hz filters (and sell the 2.8 kHz filter).

I'm not too sure what to advise you, Mike. It depends so much on what your priorities are! I LOVE the 3.3, its skirt selectivity is great. I'm happy I have it 'available'.

As to the 2.8/3.3 vs. 2.4/2.4 you are almost right on the $$$, there is no 'big' difference. And as you noted, with the excellent AM and S-AM filter arrangement I have now, I don't use it as much.

One thing I can tell you and it's true, it's how nice it is to have so many bandwidths for the voice modes available. That's MY priority. Now you're talking CW 500Hz filters, you have to decide on that. I do very little digital or morse reception, and only sporadically SSB the hams or other utilities.

I hope you will like the Kiwa/(Rado) mods! Let me know directly when you get the rig back from WA so we can share more filters (and other) impressions. Where are you at? I'm in Southern CA.

I'm in Toronto (southern Ontario, Canada). Kiwa should receive my R75
on Monday -- so I'm not expecting it back for at least one week. I'll
let you know what my impressions are when I get it back.

Could it be one of the following:
CFJ455K5 (nominal 2.4 kHz)
CFJ455K8 (nominal 1 kHz but 1.5 in actual use)
CFJ455K14 (2.2 - 2.6 kHz)
CFK455J (nominal 3 kHz but more like 3.8-4.0 in actual use)

From: Scott Medlin
Topic: 453 Message: 453

The price on the IC-R75 this past weekend at the Dalton, Georgia (USA) hamfest was US$430.00. I'm not sure whether or not it included the DSP board, but what a bargain!!! The price has dropped over US$100.00 since I bought mine in August 2000.

Hey that sounds great ! Who was that dealer by the way ?
We have a hamfest coming up here locally in Charlotte NC
(USA) on the second weekend in March and I will be looking
very closely at the prices too.

I am planning on getting my second R75 to place on my
nightstand for listening to Shortwave bedside.
Currently I have been using the Sony 2010 for that purpose
the last several years but do not like its small dimly lit LCD
display. Also you have to look at it at the right angle or you
completely miss it. The display on the R75 really shines in
that area (literally.) Crystal clear and very readable. Also on
the 2010 the SSB always tended to distort on strong signals
requiring a constant adjustment on the RF gain control. The
R75 is much superior in that area.

I am going to hate to lose the FM band when I switch, but I
figure that a cheap FM clock radio will work fine for that
purpose. I never use the Airband receive on my 2010 so I
won't miss that either.

I will leave some feedback on the pricing here at the upcoming
Hamfest in Charlotte.

C.T. Morgan was at the Charlotte Hamfest last year so
anyone in the surrounding Charlotte NC area would make
their trip worthwhile if he does indeed make another
appearance this year.

Last time I went to CT Morgans website it was not fully
operational so it seems he prefers to deal at the Hamfests
instead of the Internet. You can save on shipping that way
but you also will end up paying sales tax instead.

I hope to go early this year and catch the best deals.
His supply of ICOMs went FAST last year and he did have
the lowest rock bottom prices last too. AES and HRO are
also two of the larger dealers competing for sales at the event.

The Hamfest details can be seen at http://www.w4bfb.org/
if anyone would like to attend.

460. R75 DSP comparison

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-09 04:52:33 UTC
From: khgrant@ix.netcom.com
Topic: 460 Message: 460

Does anyone have experience using other DSP's besides the Ut-106?
I use and depend on mine, but have been wondering how it rates compared to say the Timewave zx599 or the MFJ units. Can anyone provide some useful comparisons?

Seems like the external units might provide better control over the filter characteristics. I get annoyed at buzzing noises that the UT106 cant eliminate. It works well at knocking down the hetrodynes (whistles), but pulsing or buzzing noises it cant seem to handle. Can these other units deal with these?

Thanks for the help

Keith

ps: the list has been awfully quiet lately. Anyone hear anything interesting?

461. Smart Icom Problems

All
I'm having trouble with Fineware's Smart Icom Control program for the R75. Does anyone else have problems editing frequency entries in frequeny file? I can't change the value of preamp settings or antenna selection fields. No matter what I select for the preamp setting or antenna selection, the values always default to the same values. I end up having to save the file to disk and bring up a seperate editor to fix them.

I have the demo version of the program. Are these disabled in the demo but functional in the full version?

Does the full version have a better editor for entering frequencies or a way to import text data? I find the editing process cumbersom. It wont let me insert a blank row (you know, slide the other rows down). bummer.

I keep thinking a new improved version will be out, so I haven't purchased it yet.

Anyone else like this program?

Keith

I'm confused on what you're asking, bit it sounds like you're trying to edit your memories. If this is the case, you need to first capture your existing memories from the radio. This can be done by selecting ther capture function from the memory menu. Then you can edit using the built-in features, as it's not disabled in the shareware version.

Hi.
I have the MFJ-784B and did some comparsions a while back.
Autonotch: The speed (attack-time) seems to be the same. I find the MFJ to be somewhat deeper. For some reason the UT106 sometime fails to null hets in AM-mode (I haven't researched this further. Yes, I know, the manual says "only SSB"). The MFJ wipes out nearly everything, not to mention using the two manual notches.
NR: I don't know the denoise-technique for the UT106, but it "sounds" to be LMS, the same as for MFJ.
Using the MFJ, the signal level is more or less unaffected, but the sound is slightly more muffled and "rounder". UT106 decreases the signal level.
I measured the MFJ and it has a true 20dB reduction in noise. I've not measured the UT106.
Both produces bubbling/echoing when NR-levels are near or at maximum.
Note that these are my own personal and subjective findings.

> comparisons?

Hello Keith,

A few comment s on DSP:

JPS NIR-12 (no longer in production) had an excellent auto notch. Much better
than the UT-106. However, it added some really strange artifacts for the DSP.
Sounded much like a waterfall tricking and it chopped the audio when the DSP
was turned up too much. CW filtering was great and I suspect it was made
mainly for that and the digital modes. It had dual digital processors and was a
solidly built unit. If I had to listen to radio on a constant basis such as a contest
or other reason I believe the DSP would indeed reduce the listener fatigue. It's
much easier on the ears with it turned on. I just found,for me, hearing the sound
most clearly and naturally was done by turning off the NIR-12 with the
exception of using its superb auto-notch feature.

I just did not like having over $300 dollars invested in an outboard DSP which
is why I sold my NIR-12. They still can be found used and they have kept their
value so that must say something about its effectiveness for some people.

As for the buzzing that sounds more like an electrical interference problem
which could be solved by an outboard noise cancellation unit or finding the
source of it. I think MFJ now owns the rights to the older NIR-10 ?
(I think this is right) which was real effective I am told.

All in all, the add on UT-106 DSP module does a nice job and I am happy with it.
I agree with others on this group stating that the UT-106 seems most effective
when adjusted at or below four.......The NIR-12 was about the same being
most effective at the 10 o'clock position which equated to about a 4 on a
numeric scale reading.

Universal currently has a special on the ad on ICOM UT-106 DSP module.
($39.95 with purchase of an R75) Expires April 15,2001

http://www.universal-radio.com/catalog/commrxvr/0175.html

Not a bad deal !

Just thought I would pass that along for any future R75 owners.

465. Newbie filter questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-10 00:03:09 UTC
From: alanbarta@home.com
Topic: 465 Message: 465

Greetings:

I'm considering the purchase of an R75 but I'm bit confused about how the IF filtering works. Some of my questions are probably a bit bone-headed and result from my incomplete understanding of the R75's triple-conversion superheterodyne (and superheterodynes in general).

Here is how I understand the stock R75 filtering to function. The user can choose one of three bandwidths: narrow (N displayed), wide (W displayed), and normal (neither N nor W displayed). The combination of 9MHz and 455 kHz filters deployed then depends upon receiver mode (AM, S-AM, SSB, etc.). I downloaded VK2JEM's excellent filter table from the FILES section (IC-R75_FILTERS.xls) that detail all the possible stock and accessory filter combinations. To help me understand how filtering works let's look at just the stock filter configuration (XX) for the AM mode. Here are the combinations:

WIDE 15 + 15 = 15
NORMAL 15 + 6 = 6
NARROW 2.4 + 6 = 2.4

Thus, it appears that the resultant bandwidth is determined by the most narrow of the IF filters. Now my questions:

Because the resultant bandwidth is determined by the narrowest IF filter, how important is the bandwidth of the other filter? Put another way, what if the NARROW was 2.4 + 2.4 instead? How would this be different? I assume that this affects image rejection but help me out.

The KIWA filter upgrade moves the 6kHz (455kHz IF) filter to the 15kHz slot and puts a 3.8 kHz filter in the 6 kHz slot to improve AM selectivity. Thus I presume for AM the following would be true:
WIDE 15 + 6 = 6
NORMAL 15 + 3.8 = 3.8
NARROW 2.4 + 3.8 = 2.4
Can the removed 15 kHz filter be installed in the slot for optional filters? Any comments on the loss of the 15 kHz bandwidth are also of interest to me.

Thanks in advance. All the best, Alan

Sorry I wasn't very clear. I didn't have the app running in front of me.

I have a couple of problems. One, I am trying to edit entries in the current memory file. I press the insert key on the entry I want to modify. I want to change the antenna input selection and/or the preamp setting. I modify the appropriate fields and click on save. The line in the memory file I just edited did NOT get modified. Setting the preamp or antenna fields has no effect.
Another problem I had tonight: I created a new memory file and filled out about 60 frequency entries. I tried downloading it (filling) to the radio. It

went through the motions of loading it, but when I checked the channels in the radio, they were not modified. I tried several times with no success. Suspicious, I opened up the *.mem file in a text editor and found that parts of each entry were garbage (filled with '?' characters). I don't have the file in front of me but the text label and about 5 bytes to the left of the label field were all messed up. What might be wrong?

I think I am running 3.24c (I cant tell for sure because the version number does not show up in the software at all - hint, hint).

Any suggestions?

Thanks,

Keith

And you, the operator, configure the the filter combination (by
selecting one 9 MHz IF filter and one 450/455 kHz IF filter) for each
narrow, wide, or normal setting for each mode (FM, AM, USB, LSB, CW).

> I downloaded VK2JEM's excellent
> filter table from the FILES section (IC-R75_FILTERS.xls) that detail

>
> WIDE 15 + 15 = 15
> NORMAL 15 + 6 = 6
> NARROW 2.4 + 6 = 2.4

You could also have 2.4 + 2.4 for AM but not for S-AM. In the S-AM
mode you are only permitted to choose between the 15 kHz and the 6 kHz
- 450 kHz IF filters.

> Thus, it appears that the resultant bandwidth is determined by the
> most narrow of the IF filters.

Yes.

> Now my questions:
>
> Because the resultant bandwidth is determined by the narrowest IF
> filter, how important is the bandwidth of the other filter? Put
> another way, what if the NARROW was 2.4 + 2.4 instead? How would
> this be different? I assume that this affects image rejection but

> help me out.

Noting the restriction for S-AM noted above, the following is considered for the plain AM mode. The selection of 2.4 + 2.4 versus 15 + 2.4 or 2.4 + 6 has an affect on how the PBT (passband tuning controls work). For example, with the 2.4 + 2.4, turning either the inner or the outer control will cut the width of the passband -- turning both in opposite directions will cut the width even more dramatically. However, with the 15 + 2.4, turning the inner control will only shift the passband but will not cut the width (i.e. it's a sliding 2.4 window) and moving the outer control will virtually have no effect. Somewhat similar situation for the 2.4 + 6 combination.

I should mention that in general, that the PBT controls have virtually no effect on the 15 kHz and 6kHz filters. But since the (inner) PBT control does have a noticable effect on the 3.8 kHz filter, then the operator can effectively use the (inner) PBT control as a passband shift in the S-AM mode with the 15 + 3.8 combo -- hence, synchronous selectable sideband (at least somewhat).

I presume that in the case of the 2.4 + 2.4 combo, one has a better chance of not getting any unwanted signal but in actual listening I don't think I noticed any difference over the 15 + 2.4 (this is assuming the that the PBT controls are in the neutral position).

> The KIWA filter upgrade moves the 6kHz (455kHz IF) filter to the
> 15kHz slot and puts a 3.8 kHz filter in the 6 kHz slot to improve AM
> selectivity. Thus I presume for AM the following would be true:
> WIDE 15 + 6 = 6
> NORMAL 15 + 3.8 = 3.8
> NARROW 2.4 + 3.8 = 2.4

This is true for the S-AM mode. For the AM mode you could also have 2.4 + 2.4. And with optional filters installed, there are more choices (e.g. 2.8 + 3.8 [S-AM and AM], 2.8 + 3.3 [AM only], 2.8 + 2.8 [AM only].

> Can the removed 15 kHz filter be installed in the slot for optional
> filters? Any comments on the loss of the 15 kHz bandwidth are also
> of interest to me.

The removed filter is a small Murata filter and cannot be installed in either of the optional slots. The optional slots accept those large crystal filters and must either be a 9 MHz IF filter or an 455 kHz IF filter. The Murata filter, which couldn't fit in either slot, is a 450 kHz IF filter.

The removal of the 15 kHz filter will have some effect on the FM mode, where you would then be forced to use 15 + 6 (sometimes you need a little wider bandwith than 6 kHz for FM) but you could still listen in FM mode.

I think he 2,4+2,4 combination will have a combined bandwidth of something like 2,1-2,2 kHz and much tighter skirt selectivity, removing interference better.

470. R75, Drake R8B, or Ten-Tec RX320? (was Re: Newbie filter questions)

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-10 16:49:19 UTC

Topic: 465 Message: 470

Thank you (Michael) for answering my R75 filtering questions with clarity!

I've been trying to decide which receiver to purchase and I think that the R75 is probably the best choice. I'm currently using a Drake SW-8 which I am satisfied with but I want computer control and I'd like to have something that won't be obsolete for some time.

I've narrowed my choices down to the Ten-Tec RX320, Drake R8B, and Icom IC-R75. I know that these receivers are in different price and performance classes so this is somewhat like comparing apples and oranges. I know that I would be satisfied with the R8B but I'm not sure that the price premium over the R75 is something I want to pay. The main advantage of the R8B appears to be it's excellent selectable sideband sync. My concern is that Drake may once again exit the SWL market. Used R8 and R8A receivers lack the improved sync and are in the same price range (if not more) than the R75. I also like the smaller footprint and external power supply of the R75.

The Ten-Ten RX320 is sounds like a great value and I would love to support a company that is as open as Ten-Tec with their interface code and design. I just think that the R75 probably offers both better performance, can be used without a computer, and is an incredible value at under $600 (in the US).

Any advice from R75 users for me?

Thanks in advance, Alan

> I've been trying to decide which receiver to purchase and I think
> that the R75 is probably the best choice. I'm currently using a
> Drake SW-8 which I am satisfied with but I want computer control
> and I'd like to have something that won't be obsolete for some
> time.

- The R75 has a great thing going for it and the main thing that convinced me at first was its competitive price. You could buy two R75's now for the price of one R8B! Of course this does not include any optional filters. I was at a local Hamfest today and saw the R75 selling for right at $450 USD

- I was contemplating the purchase of a Drake R8B to start with and did not really want to set aside that much money in a receiver since I am also involved in Amateur Radio and have many other radios besides this one. I discovered after my purchase of the R75 that it was really a well built receiver.
The first thing I did was to open the covers and accomplish the Rado Synchronous Detect Modification. When I did , I saw some excellent construction that I had never seen before in any of my other Amateur receivers. The little details such as shielded ribbons cables inside going to the front panel and conductive gaskets to provide a positive RF bond with the outer casing really told me it was first class in construction. These things could have been left out but they were not.

- I had seen the R8A at the Dayton Hamfest and did not like the low resolution LCD display. It seemed to just wash out when I saw it. This was years ago and this problem may have been corrected in later models. Also, I had read about someone doing a modification to eliminate the interference that its LCD display was emitting. I cannot verify this since it was from a second hand source.
It seems ICOM wanted to avoid that problem since in its R75 construction, it employs the use of copper shielded ribbon cables.

- Also, it seemed like the convertor to add VHF receive to the R8B was a little on the expensive side. A dedicated scanner could be purchased for that amount and accomplish the same. The R75 has the VHF - Lo (30 to 60 MHz) band already built in it.

- I don't use computer control on this end for my R75 so I can't give you input on that. I must say programming the R75 from the keypad was not difficult at all.

- I am sure the R8B radio is a nice receiver with its bells and whistles (including the sync selectable sideband) but on this end I found the R75 was the best choice for me.

- It would be nice to hear from past or current Drake R8B owners on this comparison.

> the R8B appears to be it's excellent selectable sideband sync.

RE: It is important to note that, while the R8B's sync detector circuit is superior, the R75 has the best passband tuning feature of ANY radio currently available in its price range. Further, the R75 is one of the few receivers available with 1-Hz tuning resolution. Combined with its excellent stability and dual I-F passband adjustability, such precise tuning UNIQUELY qualifies the R75 for excellent ECSS use.

Using ECSS also allows the operator to access the R75's full selection of both stock and option-added filters. Using the receiver in ECSS mode, with the optional 3.3KHz filter (FL-257), produces outstanding results, often superior to that obtained with synchronous detection. Of course, the sync circuit has the singular advantage of maintaining proper BFO phase with respect to the received signal's carrier, but all other aspects of synchronous detection are either met or exceeded with careful ECSS and the right filtering.

The process of selecting one or the other sideband with a sync detection circuit brings only limited ability to shun interference. This is because there is only so much space between the sideband and the carrier frequency. A filter with proper bandwidth and a steep slope, combined with passband adjustability, will provide better results. When using ECSS, you've already got the ability to switch sidebands, so the results are frequently superior to those obtained using synchronous detection, especially on receivers which fall short in other areas.

From: DanJBlack@prodigy.net
Topic: 473 Message: 473

Hi!

Universal Radio is now offering the Icom IC-R75 at a great price of $569.99. In addition, the UT-106 DSP unit is available with the purchase of a new R75, for just $39.95. This makes for an incredible deal, considering what I paid for mine! I have not seen this combination priced lower, EVER, brand-new and with full warranty.

I am taking advantage of this offer, even though I presently own an R75. Too good to pass up, and I can outfit the receiver with a different filter combination for amateur SSB and data/utility use. I have been looking for a good receiver to increase my enjoyment of the radio hobby, but have found nothing better for the money than the R75. So, why not just get another, instead of compromising on something less?

In addition to the receiver and DSP special, Universal is including an antenna book in the offer! This company is one of my top sources for equipment and accessories, and I feel their service is excellent. For anyone interested in picking up this great all-purpose receiver, I hope this posting will help in deciding on its purchase.

Please note: I have no affiliation or connection with Universal Radio in any way. This is strictly my own viewpoint, as an R75 owner and customer of Universal Radio.

ALSO: I will soon have up for sale, a nice Drake SW2 receiver with selectable sideband synchronous detection, as found in the much costlier Drake R8B. This unit will be for sale upon receipt of my new R75, if anyone is interested in a moderately-priced SWL rig.

Best Regards,

Dan

ECSS, or Exalted-Carrier Single Sideband, is a standard and very effective technique, proven over decades of use by radio operators. The simple explanation is, using SSB to tune an AM standard carrier signal containing two sidebands. Accuracy and stability are necessary to accomplish the best ECSS, something which is practically unattainable even with with many of today's PLL receivers.

With "step-tuned" receivers, increments as large as 50 Hz or more can prevent precise tuning with ECSS. The AM carrier must be "zero-beat" with respect to the receiver's BFO/local oscillator. The two biggest advantages of ECSS tuning, in a receiver capable of doing it well (such as the R75), are:

1) Minimizing the effects of AM signal fading, resulting in greatly reduced distortion;

2) Reducing the filter bandwidth required to process the received signal, thus enabling the use of narrower filter passbands to reduce interference.

The latter effect results from the fact that only one of the two AM sidebands is required for signal reception. The opposite sideband can be dispensed with, resulting in a much narrower usable bandwidth.

Since SSB receivers typically employ narrower filters, the reduced bandwidth requirements allowed by ECSS tuning can be used to great effect in reducing adjacent-station interference and "splatter".

The choice of which sideband to use, is often dictated by whichever sideband is closest to an interfering signal. By merely selecting the sideband which produces the least amount of interference, you can

get "two for the price of one" benefits in fighting interference.

I have found the technique produces excellent results with bandwidths ranging from around 2.5 KHz and up. Icom offers a 2.8KHz filter and a 3.3 KHz filter, both of which produce good results for general SWL.

The technique is also much less expensive to achieve, than by adding expensive aftermarket accessories and modifying circuitry. Much greater "bang for the buck" and you don't have to worry about filter mismatching and the ruining of factory "circuitechtures".

Hope this answers your questions!

Dan

Joe,

Danny B. explained the 1st part very well to you.

That cut off point you mention is roughly around 10MHz.
Lower frequencies will use LSB, higher frequencies USB.

Topic: 473 Message: 478

Well Danny I bought mine from Universal in December for $569.99 too including the book and the DSP unit, which Icom sent me in less than 10 days. I'm sure that several other colleagues here in the e-Group (?!) took advantage of that offer which ran 'til the end of the year I think. But you're right, the price they have now is very good too, I agree. They will also offer you support if necessary.

There have been reports of other, 'lesser' dealers luring prospective R75 buyers with prices of less than $500.00 (C.T. Morgan at hamfests, etc.) But...what about a solid warranty and service afterwards? Can you count on that? Hmmmm! Besides, it doesn't include the nice-to-have DSP factor, then an over $100 expense if wanted.

So...how much are you going to ask for the SW-2?

ECSS - Exalted Carrier Single Sideband - A method of using single sideband to tune AM broadcasts. For those that don't have synchronous detection, this works pretty well.

Generally, on amature bands LSB is used below 10 MHz, USB above. But if you are listening to utilities or military, they almost all use USB. Just depends on what you are listening to.

List Users,

Based on a tip by Keith Grant last weekend, a rather significant bug was found that caused problems when modifying memory channels. Here is the full list of fixes:
- Fixes Antenna, Attenuator and Preamp items in Modify Memory.
- Fixes single-channel memory fills when doing Insert or Modify Memory.
- Fixes Notes to allow 2 extra numeric characters (for total of 8) when naming channels.

A fixed version (Version 3.24e) has been uploaded to our web site at: http://www.fineware-swl.com/sic.html.

Upgraders are reminded that they should install the update using the "Compact" option, which only updates the executable program.

73,

Mark J. Fine / mark.fine@...

RE: More accurately, for those who DO have synchronous detectors, but whose receivers "tie" synchronous detection to the AM mode only, thus precluding the use of the receiver's superior SSB filter matrix. Even with sideband-selectable detectors, AM-mode filters are often too wide to be effective.

This in turn, limits the user's choice of tools to fight interference to merely switching off one sideband or the other---a much less effective tool, on its own. In such circumstances, ECSS will produce better results if the SSB filter bandwidth is appropriate.

Unfortunately, there are many receivers on the market which feature synchronous detectors, but are woefully inadequate when attempting ECSS techniques. This can be due to lack of stability, tuning increments that are too large to allow BFO centering, lack of adequate SSB filtering or any combination of these.

In fact, some manufacturers of receivers employing sync detectors, use the feature to allow design shortcuts in these areas, since synchronous detectors can compensate to a degree for shortcomings in stability and filtering. This is one reason why SD is so beneficial to radios that do not support ECSS well.

Danny

ECSS - Exalted Carrier Selectable Sideband

There seems to be some confusion between ECSS and the ECSS "technique". In the former, the original carrier is phase-locked and a synthetic carrier is reinserted -- hence, "exalted carrier". "ECSS" appears to be a synonym for "synchronous selectable sideband". In fact, JRC refers to the sync detector on the NRD-545 as "ECSS", while Passport to World Band Radio refers to the same feature on the NRD-545 as "synchronous selectable sideband".

The ECSS "technique" on the other hand is *not* ECSS. Rather, it a method employed by operators to achieve *some* of the benefits of ECSS. That is to say, the operator tunes in the AM transmission using USB or LSB, then "zero-beats" or adjusts the receiver's tuned frequency as close as possible to the station's freqency, attempting to remove the beating that results from the receiver not being right on frequency. The tecnique is most effective in radios that have both high stability and small tuning increments (i.e. 1 Hz).

While the ECSS "technique" can produce some benefits in the appropriate radios, it is no substitute for a synchronous detector. The ECSS technique will still suffer from selective fading. The tecnique is inconvenient, with at least some phase mismatch and occasional retuning required (and a loss of volume in the R75). However, with a poorly implemented synchronous detector or with a double sideband only synchronous detector, there will be many occasions where the the ECSS technique will be preferred over the sync detector, assuming one has an appropriate radio like the R75).

Thank u Dan and all
I never have done well with text books, in the military the gave me a kind of 'scholastic narcalepsy' the was often mistaken for sleep :)

Your excellent explanation raise a few more questions with me. I think I almost have it so please bear with me. I realize this is off topic but I think I am close to a better understanding of my receiver.
I was apparently mistakenly that for normal broadcast the sine wave produced was a single wave changing in amplitude, width and frequency. I am aware the SSB bisects the wave into upper and lower waves but I am a bit confused.
U mention 2 side bands. (which makes sense as they are called side bands) Are these the outer width of the single wave or are they different?
These would be what is synchronized by S-AM ? zeroed by bfo?
I realize if we increase the speed; i.e., the frequency-that is what we do when we tune a radio, increase in amplitude corresponds to how loud or signal strength? So most of what we are doing is corresponds with width?
Thanks
Joe

>
> There seems to be some confusion between ECSS and the ECSS
> "technique". In the former, the original carrier is phase-locked and
> a synthetic carrier is reinserted -- hence, "exalted carrier".

RE: ECSS does not require phase-locking. Synchronous detection DOES require phase locking, to be called "synchronous". That is what SD does in the first place---it synchronizes the "synthetic" carrier (BFO) with the received signal's carrier. There is no "reinsertion". Without a second reference carrier/BFO, there can be NO phase locking. Hence, both methods employ the same process, with the exception of the synchronization itself.

"ECSS"
> appears to be a synonym for "synchronous selectable sideband".

RE: This may be part of the problem, because ECSS is NOT synonymous with synchronous detection. The two processes are separated by the act of phase-locking of BFO and received carrier. With ECSS, the phase cannot be "locked".

In
> fact, JRC refers to the sync detector on the NRD-545 as "ECSS", while
> Passport to World Band Radio refers to the same feature on the NRD-545
> as "synchronous selectable sideband".

RE: Whether or not the sidebands are selectable, has no bearing whatsoever on the synchronizing of the two carrier signals. Synchronization refers to the carrier and BFO components, not the sidebands. An unmodulated AM carrier can be phase locked the same as one with modulation. The term "synchronous selectable sideband" is misleading in this respect, and can be interpreted as meaning that the sideband is synchronized. Of course, this is not the case!

>
> The ECSS "technique" on the other hand is *not* ECSS. Rather, it a
> method employed by operators to achieve *some* of the benefits of
> ECSS.

RE: Refer to my earlier "RE", above. ECSS *is* ECSS! ECSS *is not*
synchronous detection. THIS is the confusion point. And I challenge
your statement that ECSS achieves only "*some*" of the benefits of
synchronous detection. ECSS differs from SD--ONLY--with respect to
the phase-locking of the carrier and BFO components.

That is to say, the operator tunes in the AM transmission using
> USB or LSB, then "zero-beats" or adjusts the receiver's tuned
> frequency as close as possible to the station's freqency,
attempting
> to remove the beating that results from the receiver not being
right
> on frequency. The tecnique is most effective in radios that have
both
> high stability and small tuning increments (i.e. 1 Hz).

RE: CORRECT! Exactly on target! Stability and accuracy are the two
KEY ingredients to successful ECSS operation. Which is why the method
does not work well with many of today's receivers, as I stated in the
beginning! Manufacturers can "cut corners" in these two areas,
because SD's side effects allow them some leeway to get away with it.
This keeps costs down, of course, but in the long run results in a
less stable and coarser-tuning product. There is always some price
to pay, and manufacturers can use SD to "cover their tracks".

> While the ECSS "technique" can produce some benefits in the
> appropriate radios, it is no substitute for a synchronous detector.

RE: Correction: It is no substitute for the benefits of a synchronous
detector in receivers that lack stability and accuracy in tuning. As
far as "appropriate radios", I contend that receivers are becoming
less and less "appropriate" these days to anything other than AM
broadcast (either MW or SW) reception, where stability and tuning
accuracy are less telling in their absence.

> The ECSS technique will still suffer from selective fading.

RE: So will SD. When the carrier of a signal fades to the point of
uselessness, both ECSS and SD will "provide" a detectable carrier.
Since the signal's carrier at that point is no longer usable, there
is nothing left for the SD circuit to synchronize WITH, and phase
lock is lost. At that instant, therefore, there IS NO EFFECTIVE
DIFFERENCE between the two methods.

Synchronous detection cannot magically "resurrect" a fade-lost
carrier. When it's gone, it's GONE, and there is nothing any receiver
can do about it! When this happens, both ECSS and SD become equally

ineffective, as they are precisely the same thing at that instant.

The
> tecnique is inconvenient,

RE: If you mean, you can't push a button and make it happen then, yes. It could be called inconvenient. What I would call inconvenient, is trying ECSS on a receiver that can't support the technique. The R75 CAN, DOES, and works very well while doing so!

with at least some phase mismatch and
> occasional retuning required
(Quote courtesy of L. Magne)

RE: This is correct. Some phase mismatch is inevitable, because there is no synchronization circuit to correct it. As far as tuning, how occasionally it is needed, depends on the receiver's stability. I'd say most portables and lower-grade tabletops need more frequent retuning, if in fact they can establish zero-beat in the first place.

(and a loss of volume in the R75).

RE: I have only noticed a loss of NOISE volume, which is more attributable to the interference and hash being removed by the better filtering available in the R75's SSB modes. If this constitutes a loss of volume, then bring it on, baby!

> However, with a poorly implemented synchronous detector or with a
> double sideband only synchronous detector, there will be many
> occasions where the the ECSS technique will be preferred over the
sync
> detector, assuming one has an appropriate radio like the R75).

RE: You got THAT right, Michael! That's why the R75 "ROCKS" as a true "communications" receiver all-round. It is not a "one-ring performer" by any means, and handles a wide variety of radio communications tasks admirably.

> was a single wave changing in amplitude, width and frequency.

RE: An A.M. signal changes in amplitude, but should not change in frequency. Ideally, there would be zero frequency change in an AM signal, but in reality there can be some minor changes in frequency resulting from effects along a signal's propagation path, particularly on shortwave frequencies where the ionosphere plays a role.

I am aware the
> SSB bisects the wave into upper and lower waves but I am a bit confused.
> U mention 2 side bands. (which makes sense as they are called side bands) Are
> these the outer width of the single wave or are they different?

RE: The sidebands of an AM signal are USB (carrier frequency + modulation) and the LSB (carrier frequency - modulation). A 1000-Hz tone modulating a conventional AM carrier of 100,000 Hertz will produce sidebands of: (upper)101,000 Hz and (lower)99,000 Hertz frequencies.

> These would be what is synchronized by S-AM ? zeroed by bfo?

RE: No, what is synchronized is the carrier itself or, more accurately, the down-mixed carrier after it has been processed by one or more I-F stages before detection. The BFO generates a signal matching the frequency of whatever the I-F stage is operating at.

> I realize if we increase the speed; i.e., the frequency-that is what we do
> when we tune a radio, increase in amplitude corresponds to how loud or signal

> strength? So most of what we are doing is corresponds with width?

RE: When we tune a radio receiver, either FM or AM, the frequency is what we are tuning. The modulation applied to the carrier in an AM signal affects its amplitude, or "height" from either side of its center frequency. The carrier frequency itself should remain constant. The modulation applied to a carrier in an FM signal, will vary its frequency, while its amplitude remains constant.

488. Passband Shift and How To Use It--Reference

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-20 17:58:07 UTC
From: DanJBlack@prodigy.net
Topic: 488 Message: 488

The February and March editions of QST magazine, contain articles dealing with IF shift and passband tuning techniques to improve reception quality and reduce interference. These are EXCELLENT REFERENCES for all radio operators, and go into depth with support examples on using the feature. The articles pertain to two amateur radio transceivers, but much of the info will apply to the R75, or any receiver with passband shift (R8B, etc.)

The articles describe effective uses of RF gain and attenuator controls, to lower the signal+noise floor into more effective regions of the IF filter skirt, thus sharply reducing adjacent-station interference. Also covered are when to use AGC and when to shut it off.

In short, it's a training primer on proper receiver operation, which many SWL's and MW'ers can benefit from, not just hams. Check them out! You will gain a greater appreciation of the hobby, improve your enjoyment of ECSS and AM tuning methods, and learn why the controls are put there in the first place!

QST is available at better book/magazine shops, or thru the ARRL.

Danny

489. R75 frequency display

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-22 18:15:58 UTC
From: Michael Moore
Topic: 489 Message: 489

Hi,

My R75 display is off. At 1 MHz the display is dead-on freqency but at 10 MHz the displayed frequency is greater than the actual frequency by about 50 Hz. Is there a simple adjustment that I can make? I asked Icom Canada, and they responded with "a 50 Hz frequency error is a minimal error. This can be error in test equipment or pass probes etc. {sic]"

Yeah, right! The error is with the R75 display -- 50 Hz is more than enough to affect SSB reception -- for example, on my radio, SSB will sound OK at 70 Hz below the displayed frequency up to about 30 Hz below frequency. Besides the inaccurate display, this makes tuning in 1kHz steps a great annoyance. Same goes for for tuning in AM signals in SSB mode.

I've check this with various transmissions and also checked the frequency displayed on other radios. So this isn't just drift. I also have the CR282 high stability crystal installed.

So if anyone can tell me how to make the adjustment, I'd greatly appreciate it.

I belive that after an installation of the crystal, it might be necessary to make some realignment of the reference frequency. Just look in the manual how to perform this.

I assumed this was already done the CR282 was installed. Thing is
that the manual only notes one adjustment to make when installing the
crystal. And as I said, the frequency display seems dead on at lower
frequencies.

It seems that this error is quite common on R75's. My own unit is off appx +20Hz on higher frequencies.
According to the manual, adjusting L2 on the PLL board should clear this out.
For Gert Nilsson: Gert, you did this if I remember it correctly? Did you use any particular procedure?

I did this adjustment. It is very easy to perform. Most international broadcasters are very accurate. I used RFI in Paris in the 21 MHz band. BBC will also be fine. Use USB or LSB and adjust L2 for the correct zero beat. Wide selectivity make this ajustment easier because the lower audiofrequencies are not cut by the filters.

495. "Scanning" w/R75??

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-27 03:44:51 UTC
From: swardfoto@aol.com
Topic: 495 Message: 495

I'm debating whether to purchase an R75 or a R8B. My main interest will be UTE monitoring.

What I really would like to know is how well does the R75 "scan" freqs? Can the squelch be set independent of the RF gain?

I'm leaning toward the R75 becuase it's UTE capabilities are excellent (plus the fact that it's at least half as expensive as the R8B), but I would like to have some "scanning" capabilities.

Any feedback is greatly appreciated,

sward

The R75 does make a good UTE reciever!
The R75 can scan. The squelch and RF gain are tied together on the same knob in an interesting way. Minimum gain is at the 7 oclock position, max is at 12 oclock. turning further to the right is squelch control, with max squelch (I think that is how you describe it) at the 5 oclock position. Squelch breaks open near the 1 oclock posiiton. I hope you can understand my description. You can also configure the control so it is RF gain only (no squelch), or squelch only (full RF gain).

I'm not sure what your interest was. When using squelch, RF gain is at maximum.

I don't think you wlll be dissapointed with a R75.

Keith

498. Passband Tuning + Filters

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-29 23:30:46 UTC
From: bobs@aaahawk.com
Topic: 498 Message: 498

Got my R75 yesterday and am in the learning stage. So far so good. I installed the DSP unit and that seems to work well.
At this point I have a couple of questions I need answered.

1. Should the Passband work in the AM mode? Mine doesn't.

2. The entire subject of filters confuses me. What are 9MHz IF filters vs 455 KHz IF filters? Which filters are in my stock R75? In AM mode which filters are used for N, W? Same qustion while in SSB? I know this is probably basic to most but if you can I need a little help.

Thanks.....More questions will probably follow.

Bob

Danny,

Thanks for all your info. My local county library doesn't carry QST
but one of the branches about 30 miles away will copy and sent to
me. I need the article titles, month of publication and page #s. It
would be great if you could provide that info.
BTW, neither issue is currently in the stores.

Thanks...Bob

It works in AM mode but most folks wouldn't be able to tell. The PBT will shift the passband +-1.29 kHz (with the wider filters). So with the stock filter available for AM (which is 6 kHz nominal -- probably much closer to 7 in reality), there isn't enough shift in the passband to cause most folks to notice. However, with a 3.8 kHz filter (replacing the 15 kHz 450 IF filter) installed or with the optional 3.3 kHz 455 kHz IF filter (from Icom) installed, the PBT clearly demonstrates that it works in AM mode.

> help.

See page 18 of the manual for a listing of the filters.

The radio has a triple conversion design. Incoming signals of the selected frequency (i.e. the frequency on your display) are converted to an intermediate frequency (for processing, filtering, etc.) There are three conversion stages in the R75 -- the 1st one at approx. 69 MHz, 2nd one at approx. 9 MHz, and the 3rd one at either 455 kHz or 450 kHz depending on the filter selected. Icom has placed slots for two optional filters, one each at the 9 MHz IF and again at the 455 kHz IF. The outer PBT control shifts the passband of the 9 MHz IF, while the inner PBT control shifts the passband of the 455 kHz IF.

You may want to read the past messages in this group relating to filter selection.

You select which combination of filters (one 9MHz IF filter and one 455/450 kHz IF filter for each setting from the available filters installed in your radio) are used for the "N", "W", and normal (no indicator) settings. See page 19 of the manual.

501. Kiwa Mods to R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-03-30 04:37:42 UTC
From: Michael Moore
Topic: 501 Message: 501

I've had my R75 back for Kiwa for about a week and a half now, but have had only little time to play with it. Nonetheless, I notice distinct improvements. Here is my initial impressions:

The AGC fix and perhaps to some extent, the audio mod, really removes the distortion that, previously, was particularly noticable in the AM mode. Now the audio is *extremely* clear and isn't easily affected by fading signals as it was before the mod. This modification is so good that the sync mod then becomes alot less important. (I'm unsure as to how much is attributable to the AGC mod and how much is attributable to the audio mod.) I tried feeding the audio into an Optimus PRO-X44AV speaker. The audio was absolutely fabulous (although only average dynamic range). The sound was full and had a good bass. Before the mods, with the external speaker connected, the AM distortion was so noticeable as to make listening with an external speaker unpleasant. Now, it is very pleasant.

The sync detector now works, ie. it maintains lock. It whistles when gaining lock and whistles when it loses lock. From the sounds of the whistling when the sync detector locks, relocks when tuning, and loses lock on faint signals, etc., it sounds just like Rado described concerning his ver 1.1 mod. While testing it on a *very weak* station, it kept whistling/howling (before the mod, it seemed to make no attempt to gain lock). With the dramatic improvement to the straight AM, it's now somewhat more difficult to find signals (with rapid fades) that would easily demonstrate the difference between the sync AM and straight AM. Nonetheless, in the sync AM mode, audio and especially music appeared to suffer less from fading.

The addition of the 3.8 kHz filter is just what the doctor ordered. This is a perfect width for narrow AM/S-AM. I tried it on Radio Havana, which had one sideband being interfered with. With sync AM, the 3.8 kHz filter and the inner PBT control turned to one side, the signal came in clear and sounded beautiful. I had been considering buying another 3.3 kHz filter (many months ago, I had taken the one I had out of the R75 and put into the AR7030+) but with the 3.8 kHz filter installed by Kiwa, I have since changed my mind.

Also, the NR now seems to work better. On this point, I'm not really sure if this is just subjective on my part or not. Before the mods, the NR seemed to reduce signal and noise in equal proportions, rendering it rather useless. Now it doesn't seem to attenuate the signal as much (or it seems to reduce the noise more) as it did before -- actually making it useful.

These are *my* impressions. Your mileage may vary.

Cheers,

--
Michael Moore

RE: Thanks, Bob! For others who are running into any difficulties locating this excellent information, the article is published in two parts---one each for the February and March 2001 QST issues. I feel the March issue is the one most R75 owners will "relate to", because the subject transceiver of the March article has a more similar bandpass shift control, than the one covered in the February issue.

The article is titled "How to Maximize Your Receiver's Effective Selectivity..." and is authored by Larry Scheff, w4QEJ. The March issue contains Part Two, on pp. 44-47. For those interested in Part One, it appears in February's QST on pp. 42-48.

The article, especially Part Two, offers a terrific visually-aided primer on passband tuning, filtering and the use of attenuation/RF gain as weapons against interference. It may also serve to highlight the TRUE importance of these features, to those who are accustomed to using their RF gain and attenuator controls strictly as "overload dampers". I hope many will gain a new respect for their R75's after reading this article, and particularly Part Two.

Good Listening!!

Danny

QST/QEX ARTICLE REPRINT ORDERING PROCEDURE

NOTE: Due to copyright laws we are not permitted to make copies from any other magazine, but our own. Please contact other magazine publishers directly.

All QST and QEX Article Reprint requests should be directed to the ARRL Technical Department Secretary, Monique Levesque (see below for contact information).

CHARGES (charges include postage fees)

$3.00 per article reprint for Members
$5.00 per article reprint for Non-Members

PAYMENT

We encourage prepayment for article reprints to both Members, and especially, non-members, however, you may elect to be sent a bill for the amount due.

Payment is accepted in the form of personal check, money order, bank draft or Credit Card (American Express, Discover, Visa, Mastercard). For your protection, it is encouraged that you do NOT submit credit card information via the Internet; please call OR Mail the Credit Card information.

IMPORTANT INFO
---
* All article reprint requests are processed on Monday and/or Friday's. PLEASE ALLOW 3-4 days for postal delivery (longer for International Orders)

* All articles are sent via First Class US Mail or Air Mail. ONLY PRODUCT REVIEW ARTICLES can be faxed.

* Please include Mailing Address on all correspondence to ARRL Hq.

QST/QEX BACK ISSUES

Back Issues are limited. Contact the Circulation Department (see contact information below) for availability.

508. USB Sound Files

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-07 22:43:59 UTC
From: Liam O`Connellan
Topic: 508 Message: 508

Hi everyone, I am in the process of buying the R75 minus the DSP.
The radio will solely be used for HF Airband. I have read the reviews in various mags and have come to the conclusion that it performs best for SSB reception. Thats not to say that the DSP will not be purchased at a future date. I use a MVT7100 for VHF Air and also a NASA HF-4E for HF Airband. i find the Nasa a great set but It requires a fairly large lump of wire to drive it plus a good earth connection for freq`s below 1Mhz. The earth certainly makes a big difference when hunting low stuff.
WhatI as hopeing is that someone might have some SSB sigs converted to sound so as to get an idea of the sound and quality of the rx.
If so please post them in and give us a listen...

Yours in anticpation,
Bill.

Oops,
I searched the previous posts for this topic and saw that it was already answered in the affirmative. Sorry about that folks.

I found a March issue of QST still in the racks and bought it to read about PBT. I'm interested in perhaps writing some software to automatically perform some of these functions like narrowing up the passband and increasing attenuation to eliminate the unwanted adjacent signals. Has anyone else tried this out?

Hello,

It seems that the cable must be DB-9M to DB-9F null modem type ?
I can't find it in my city. The computer stores here have only DB-9F
to DB-9F null-modem. Thank you Icom for putting a female plug !

Somebody has the wiring diagram?

Eric in Trois-Rivieres, Canada

Hi list!
Today I discovered something no documented in the manual.
In the this, says that the ANF only works in SSB.
I listening a tropical radio station in S-AM with a whistle of quite annoying bottom, I push the ANF button and it eliminated the blow completely.

Hello Mark,

This faq explains that a simple RS-232 cable is ok to
control the IC-R75 (NOT the null modem).
I went to RS to buy part # 26-117 as suggested and it works fine.

Thank you very much for your help!

Eric

518. R75 on LF?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-17 02:49:51 UTC
From: jsm@gulfislands.com

I am thinking of purchasing an R75 for the main purpose of NDB and LF DXing. If you are using the R75 for LF/NDB work, your comments would be much appreciated.

I have read earlier postings about lack of sensitivity in this range. I understand that the preamp is automatically disabled here but probably for good reasons.

Is the R75 sensitive enough in the LF range?

Thanks in advance.

Steve

I have picked up a reported LF station within my state (Texas) using the IC-R75.

It's all CW, though...and slow at that.

Reception is so-so, but I am just using an indoor RF Systems antenna.

(What is NDB?)

Thanks Bert.....an NDB is a "Non Directional Beacon"...they are located at airport runways and usually transmit a CW identifier, repeated every 10 seconds or so...there are thousands of them between 526 KHz and 200 KHz...they run around 25 watts and on nights of good propagation can be heard for thousands of miles!

522. AGC Mod and Hum

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-17 19:24:42 UTC
From: Scott Robson
Topic: 522 Message: 522

Hi everyone

I recently performed the first part of the famous Rado mod on my R75. I do not have the courage to lift pins so I don't plan on pursuing the S-AM mod part, but I was very interested in correcting the problem the R75 seems to have with competing AGC in AM mode. My SWL choices usually concentrate on fading signals (Murphy at work) so the mod seems perfect.

Indeed in my opinion it works. Fading signals are now less prone to producing white noise. However I have a very curious problem which I can't explain electronically at all. Some signals now seem to have a hum in the background (about 50-60 Hz which makes me think it has something to do with powerlines). Some signals however do not and are quite clear and crisp (even more so now). I honestly can't find anything consistant between thoses that hum and thoses that don't. It doesn't appear to be dependant on frequency, signal strength, time of day and the hum was happening before the recent solar flares. All WWV frequencies give me clear signals. I have hum on 9580 around 1100-1200z (Radio Australia) here in New England, USA. I have a computer on next to my radio most of the time, but the hum is present even when I turn the monitor and computer off. I have removed the capacitor and the hum goes away on signals that otherwise hummed. Also note, my wires from the board to the capacitor are perhaps excessively long but I have taped the capacitor to the front panel as described in Rado's mod. I don't know if that would matter.

Has anyone else experienced this? Can anyone with more electronic experience even guess at what might be going on? The hum level goes up and down too (seems to hum more when signal strength is high) and can be quite annoying as I do enjoy actually listening to AM audio from broadcast stations.

Thanx in advance

Scott Robson

P.S. anyone out there thinking of buying an R75 and think that this email is a criticism, think again. I think the R75 is a great radio for the price. You wont do better for your money.

That's interesting observation! I'll check myself when I have time. There are some signals (especially here in Asia) which have hum due to overloaded transmitter power supplies (China, Korea etc. like to push their transmitters as hard as possible). Also the frequency dependence (not station?) of the hum is strange. Before the AGC mod the AGC speed of the AM/S-AM IC is quite fast so it can probably follow the hum of the carrier.
Some questions:
1) What's the value of the capacitor you added?
2) Where did you make the capacitor ground connection?
3) Do you have another radio to check if it also shows the hum?
4) Try tuning the station in SSB (ECSS) ... is the hum there? You may need to adjust the PBT controls to pass lower frequencies. If the hum is also there in SSB then is removing the mod capacitor fixing it?
5) Can you try other stations on the exactly same frequencies as the humming ones (different time)?

Thanks for the mod feedback!
The goal is to make the radio as good as possible so any feedback is appreciated.

Best regards,

Rado

Sometimes Radio Australia has hum other times it does not. It is dependent on what frequency it is on (same time of day). Same goes for
BBS signals retransmitted from a Canadian site (this time night time in Eastern USA).

> 1) What's the value of the capacitor you added?

The value you recommended in the mod. I think 220 uF? What ever you said in the mod file I found and used.

> 2) Where did you make the capacitor ground connection?

I scratched the surface near the screw as you mentioned in the mod and soldered it there. I actually made a real mess here and solder is
touching the screw. Would this matter?

> 3) Do you have another radio to check if it also shows the hum?

I plan to mp3 a sound file tommorow moring with the mod in place. Later that night I will remove the capacitor and rerecord the following
days broadcast for comparison. I don't have another SW radio unfortunately.

> 4) Try tuning the station in SSB (ECSS) ... is the hum there? You may need
> to adjust the PBT controls to pass lower frequencies. If the hum is also
> there in SSB then is removing the mod capacitor fixing it?

The SSB demod is mostly clear though there is some hum. No HF signal is ever clear of some hum though :) I don't know if the hum is due to
the mod in the case of SSB but my feeling is their is substantially more hum on AM now than there is on SSB. If there was the same hum on
SSB that would suggest a bad signal rather than a mod fault right?

> 5) Can you try other stations on the exactly same frequencies as the humming
> ones (different time)?

I'll give it a shot tonight.

> Thanks for the mod feedback!
> The goal is to make the radio as good as possible so any feedback is
> appreciated.

No problem. My fear is I might have burnt the AM chip a little and it is now not functioning properly. I'll follow your advice and get
back to you and the group on the mod. Maybe it is just me and a bad soldering job. I still think my wires are too long and that they may
be picking up a stray hum from inside the radio. Radio builders go to great lengths to internally sheild their radios. Having long wires
would go a long way to reversing that.

Thanx for the feedback

Scott

My R-75 picks up lots of NDB stations between 150 and 420 kHz here in Saskatchewan, Canada. I haven't noticed any automatic disabling of the preamps, either, although it isn't advisable to use Preamp 2, as it tends to swamp the LF range of the receiver with strong signals from local stations in the AM broadcast band.

528. FL-103 filter - newbie asks

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-23 14:59:27 UTC
From: esapeltola@hotmail.com
Topic: 528 Message: 528

I have got my R-75 now for one week. It is a great receiver, altough audio for BC listening is not as good as in my Lowe HF-150 receiver. In the quiet conditions of Finland I tried it and was amazed how chrystal clear the reception was. For the first time I was able to hear MW-stations from Iran, India and probably Korea. I guess the atmospheric conditions were favourable, too (Easter time). Now back to Luxembourg, the stations are different.
I am just learning to use my receiver, especially the filter settings and pass band tuning. I have optional 3,3 kHz filter in the 455 kHz IF and DSP-unit. To get the best out of pass band tuning I am purchising FL-103 2,8 kHz filter for 9 MHz IF. A German on-line shop is selling a
"FL-103 SSB-Quarzfilter 9MHz/5.6kHz for 706/761/765/775/781" with the prize of 106 DEM.
I am a little bit confused with this "5.6 kHz" specification. What does it mean? Can I be sure that it is the 2,8 kHz filter that I am looking for??? What is this 5.6 kHz then? More experienced people with ICOM products, please give ear.

Other thing that I don't understand is the function of AGC. How to use it and why there is a modification for it?

Esa Peltola
Luxembourg/Finland

> does it mean? Can I be sure that it is the 2,8 kHz filter that I am
> looking for??? What is this 5.6 kHz then?

Hi, Esa. If the German company is selling a genuine FL-103, then it must be the 2.8 kHz filter, because that's how ICOM itself describes it. Guess they added the upper and lower sidebands together to come out with 5.6 kHz. Just make sure the filter is really by ICOM before you buy it.

> Other thing that I don't understand is the function of AGC. How to
> use it and why there is a modification for it?

The AGC will help keep fading signals a bit steadier, and will prevent you from overloading the receiver when you hit a strong station, to say nothing of saving your ears from sudden blasts of audio. When you tune a strong station in with the AGC on, try tuning away from the station for a moment and you'll hear the receiver's gain gradually recover, i.e. the background noise will be silent at first, and then return gradually. If you use F.AGC (fast AGC), it will recover faster than with just AGC (the slower setting).

I tend to use F.AGC when listening in sideband mode and AGC when listening in AM. The receiver is barely usable on strong signals with the AGC switched off altogether, due to extreme overload, unless you turn the RF gain way down, use the attenuator, etc.

Gerry Busch
Saskatchewan, Canada

Esa, shortly after my last message I noticed that the advertisement you quoted does not list the R-75 receiver among those radio model numbers, which all seem to be ham transceivers, so is this the same FL-103 that ICOM makes for the R-75?

Than you Gerry, it must be the right one since it is made by ICOM. It just fits to other equipment, too.

This morning I understood that I had used my RF/SQL knob in a wrong way. That was the reason for strong noise while tuning between the stations. If there are others slow to understand the correct use of RF knob, choose the setting (manual will tell how) that allows you to use minimum RF gain. It will improve the clarity of audio considerably and you get rid of excess tuning noise, and PBT works better too.

Good point about the RF gain setting, Esa. I leave mine set to RF/SQL mode, and use the squelch only for some FM signals between 30 and 40 mHz. These are signals from various utilities, such as fire stations, that come in from thousands of miles away during skip conditions.

Keeping the RF gain down can certainly help with the noise. The only thing I don't like about that is that the S meter reading increases as you rotate the RF gain control counterclockwise, so the meter can't be used effectively.

As for the PBT, that's one of my favorite features on the radio.

Scott:

Are you sure the hum was not present before the mod?

Is the radio and its cables in exactly the same location as before? Try moving it 4 or 5 feet, away from other equipment. You could be getting pickup from power cords, etc.

It is always possible your wall (floor?) wart is bad.

Let us know how it turns out.

536. Re: [icomr75] AGC Mod and Hum

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-25 13:48:38 UTC
From: Scott Robson
Topic: 522 Message: 536

HI everyone again

I removed the capacitor and once again did see an improvement in signal quality with regards to hum. Of course the old AGC was back to its
normal tricks too. This made me curious so I decided to shorten my leads running to the capacitor. This seems to have helped.

To put things in perspective, the leads I had running from the board and IC to the cap were so long I had to place the leads all over the
main board of the radio. My feeling is either the leads were somehow picking up internal noise from the radio (noise that the radio is
usually shielded from) or the leads were big enough to act as antennas and pick up as you say noise from the floor wart or other
electronic equipment I have in my room. I am pretty sure my computer is not the culprit though as the hum is there regardless of whether
the computer is on or not.

Anyway in my experience the length of lead from board components to the cap may be a factor in the hum. I will try a few more experiments
but I am very nervous about soldering to this IC and I don't want to play with it much more. I have the hum to a level I can live with.
Any more improvements I will let the group know. I just wish I had more time to play with the unit! :)

537. IC-R75 Scanning

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-25 21:07:32 UTC
From: Liam O`Connellan
Topic: 537 Message: 537

Hi everyone,

I have just bought this rx and being a novice I would like to draw on the knowlege of you guys re scanning.
I just cannot seem to get this radio to function properly in scan mode.
What are the correct settings for scanning. It misses some of the stored freqs and just when its on a certain frq it jumps to a mem where nothing is present but noise. I know that AF & RF Sq are crucial for this op but what is correct settings. I have tried everything. I am using a Aor SA7000 and 70ft random wire into atu and also sometimes balun seperately of course.
Also is there anyway to move along the stored mems with the rotary wheel instead of the up-down keys.
Its seems quite sensitive and im very happy with it, I listen to USB Aircraft only..

hope someone will help, by the way I think the manual is a joke!!

BFN,

regards,

Billy.

538. Re: [icomr75] AGC Mod and Hum

Yahoo group: icomr75 (2000 — 2002)

From: Ian Johnson
Topic: 522 Message: 538

Scott, Just in case no one has said it yet; keep the leads away from the display. Just about all digital displays generate noise and putting flying leads near it will not only induce noise into those leads, but also supply a vector for reradiation into other parts of the set. Good luck Ian Johnson Brisbane, Australia ----- Original Message ----- From: Scott Robson Date: Wednesday, April 25, 2001 11:48 pm Subject: Re: [icomr75] AGC Mod and Hum > > > HI everyone again > > > > I removed the capacitor and once again did see an improvement in > signal quality with regards to hum. 541. Q-Tek Antennas

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-04-28 14:14:51 UTC
From: Liam O`Connellan
Topic: 541 Message: 541

Hi all,

Flicking through this months copy of SWM I see that Haydon have many items on display for HF Listening. I am mainly interested in the Q-Tek Wire Cyclops, MLBA (R.F.Systems) MLB (R.F.Systems) and the MINI-Windom.+ Q-Tek Sky-Wire MKII and Q-Tek Magnetic Balun
Have any of you out there any expierence with these Antennas?
I would be most grateful for any assistance on this matter.
Personnaly I am thinking of just using a 80ft wire into Q-Tek Magnetic Balun or the Q-Tek Sky-Wire MKII. Again any advice welcome.

I find the Scanning function of the IC-R75 only average, as it does not seem to be well implemented intially but more an after though in the design process. I have 55 mems with Mil frqs and it always tends to miss the speech and stop on the digital signals, so far I have got over this by cancelling the loudest frqs (6 in all) but this seems to defeat the purpose. I used to have a AOR7030 and you could store the squelch setting after tweeking it and then carry on listening to the rest of the channels.

In one of my last posts I asked about this and got no replys, also I aked if you could step through the mems with the rotary dial? it does not say anything about this in the manual (which is bad)so I hope you can help.

Thats it for now, All replys most welcome,

Best regards,

William.

542. r 75 software retry

This weekend I won an Ebay auction for an R-75 less than a year old with very little use, included the UT-106 DSP unit and all original manuals, boxes etc. I am awaiting its arrival and wondered if I received a good deal? I paid $471.00 with shipping.

I am hoping this was a good deal as I thought I seen this unit selling somewhere for $499 from a dealer. I guess I will find out when it gets here.

Thanks in advance.

Wayne.

I don't know how ebay auctions usually go but from the limited experience I have sometimes I've seen items go for even more than retail price from some of our more favoured stores! I think $471.00 including shipping is ok. I mean it is cheaper than the bottom $500 you'd pay at universal or grove.

It does also come with the UT-106 DSP which is typically another $140! I think its an ok deal so long as the unit does actually still work to spec. I'm sure it does. I find mine pretty solid and expect it to be working well for years to come!

Anyway Wayne, enjoy the radio. You saved yourself around about $100 than buying it new (with DSP) so so long as it the thing still works to spec I think its ok. I'm sure you'll be pleased with the results. Spend that extra $100 on a good antenna! :) You might even want to try some of the mods for this radio to enhance performance.

May 1, 2001

Dear Mike;

I spoke with our technician, and he agreed with you regarding the R75 and synchronous detection. He said that item has been dropped from our upcoming Catalog 12.

If I can be of any further assistance, please let me know!

Linda Mowrey
Customer Support Specialist

He does'nt have a problem with the receiver, it is just some bad
feelings he has toward me, I knew it as soon as I seen the post. You
have weigh each post individually...

Wayne.

That's a good deal so long as it works as advertised. I just got a used one with the DSP for $500 shipped. I know that's a decent deal because the local ham shop was selling one on consignment for that price, but I would have had to pay sales tax (nearly $40) and it didn't come with the box (on top of that, when I went back with the intent of buying it, it was already sold). If I didn't get that deal, I would have probably gone the safe way and bought a new one for just over $600 with the DSP. ($569+$39)
One of the things you should always beware of when buying used rigs is if the unit was used mobile or if it was in the home of a smoker. These may sound moot, but if it was used mobile, it undoubtedly went through extensive vibrations (very bad) and if it was in the home or shack of a smoker, first of all you'll never get the smell out of the rig. Secondly, the smoke residue will actually coat the electronics and attack the components shortening its life. The first reason is actually the most important to me however.

Have fun with your new radio!

I just took delivery of a spanking new R-75 and will put it through it's Longwave trials this weekend. I also bought the 250Hz filter and instead of the DSP unit, bought the MFJ DSP filter to run the audio through. Just playing with it on the table with a 2' wire antenna ....love the 1 Hz tuning steps...worth the price just for that!

no bad feelings at all-thought it was r72 not 75. i don't even know why
you'd think
i'd have bad feelings towards you. anyway, i've owned r75-nrd535d-r71A etc.
the r75 is is a good deal. take care.

Hi Steve,
The R-75 is attenuated below 1600 kHz to prevent overloading from stron MW stations. Check the files section under "mods" to see how to defeat the attenuation for MW/LW reception.

561. R75 Computer Control of Time Clock and CI-V Transceive Function

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-05-12 23:57:59 UTC
From: DFW1417@yahoo.com
Topic: 561 Message: 561

Received R75 about 4 days ago. Its GREAT! Really love it. Just now getting into the computer command aspect and have discovered something all might benefit from. Those curious try to use the computer commands to turn on then off the CI-V Transceive function. Then try to use the commands just to read the time clock.

Is'nt that neat how no matter what you do you can't turn the Transceive function on once you shut it off? Is'nt neat that you can't read the time off the time clock.

SOLUTION:

I don't know if Icom messed this up or what but here is how to do it.

CI-V transceive on function:

FE FE 5A 5A 1A 02 13 01 FD

CI-V transceive off function:

FE FE 00 5A 1A 02 13 00 FD

Clock read function:

FE FE 5A 5A 1A 02 13 01 FD

Don't ask why, I don't know but it works. Yes it is suposed to have a to and from address different but it does'nt. The normal to address for the R75 is 5A and the from address from a computer used to control it is 00 but why just these commands have to have the same to and from address I will never know but they do.

I think the R75 is great and every bit worth the $475 with the DSP I paid for it.

Hope this helps all.

Wayne.

Hi All,

Can anyone recommend a good antenna that they have bought in the UK lately.

I am using a long wire into Global AT2000 and seem to be having ok results, just wondering if a better setup is available, I cant really stretch to more than 40'.

MTIA,

Billy.

FYI,

Just for everyone's info, HRO was selling R-75's at the Dayton Hamvention for $399.00.

Needless to say, I bought one.

Is it worth getting the DSP?

Thank-you,

Bob

Sort answer: yes.

Especially if you listen to UTE's. I find it very helpful. Some complain that it lowers the volume when enabled. That's what the volume knob is for.

Bob, it all depends on how much noise you have at your location. Here at my qth there are times when the electrical / man made noise level makes the DSP mandatory. At other times it is unnecessary. I guess only you can tell at your qth. Operationally I find that the unit works very well. Good luck. Jim

573. Audio improvement mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-05-23 01:44:34 UTC
From: Radostin Danev
Topic: 573 Message: 573

Hi R75-ers,

Well, I've been very busy lately - coming close to the end of my Ph.D.
Several days ago I've moded the audio path to improve it a little.
To check if you need this mod do the following:
- tune in a spot where there is a lot of noise, no station, just man-made noise. Other possibility is to off-tune a strong station until it starts to distort the audio badly.
- Use AM or S-AM mode
- Now the audio should be harsh - like there is some sort of clipping. It is easily noticeable if you slowly reduce the volume - there is a point just before zero volume where you'll hear only the spikes from the clipping.

I think that the clipping is due to overdriven electronic volume control [IC1251 - Main unit (2)]. I came to this conclusion because if I adjust the beep volume high enough it also produces this clipping - and the beep is fed just before the electronic volume.
Here's the simple fix which also equalizes the volume of the AM/S-AM modes with that of USB/LSB (in my R75 when I switch from USB/LSB to AM/S-AM there's a substantial volume increase, which is not very pleasant):

- Connect a 20 kOhms resistor between Pin 15 on IC1201 and ground. This reduces the AM volume and removes the clipping effect.

- Connect a 20 kOhm resistor between Pin 11 on IC1201 and ground. This reduces the S-AM volume and removes the clipping effect.

Now tuning around on my R75 is much more pleasant as the audio is clean.
I've uploaded this mod into the "Files/R75 Mods" folder. Will upload some pictures soon.

Best regards,

Rado

576. MW attenuator mod by Pete

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-05-23 02:00:22 UTC
From: Radostin Danev
Topic: 576 Message: 576

Hi R75-ers,

As observations by some users and my front-end simulations showed (see message http://groups.yahoo.com/group/icomr75/message/247, and file http://groups.yahoo.com/group/icomr75/files/Information/R75 front-end preselection simulations.pdf) the effect of shortening the pads is not as big as it should be (about 2-3 dB increase in sensitivity).
Here's an advanced MW attenuation removal mod posted by Pete Gianakopoulos on rec.radio.shortwave:

I picked up a service manual for this receiver. It seems that 100 Ohm current limiting resistors are used as the series Rs with the switching diodes in the front end. In an earlier post, I mentioned that the shunt Rs in the MW attenuator were providing the return path for the switching diode in the front end. I calculated the equivalent resistance of this network to be 139 Ohms; that is the reason that I specified the 2.2mH choke in series with the 110 Ohm resistor.
Anyway, I did change the 10 Ohm series resistor that Icom has in their unit to the 100 Ohm unit that is used in all of the other filter ranges; this eliminates the need for the extra resistor that is in series with the 2.2mH choke. I didn't like the fact that the 2.2mH choke is self-resonant at around 900KHz, so I switched that value to a 1mH Murata surface mount inductor. It may be because I eliminated some of the parasitics that were present with the 2.2mH choke, but the sensitivity on the LW band improved. The .1uV spec is now maintained down to 150KHz, degrading to .2uV at 100KHz. This is because of the noise floor rise at 100KHz and below, maybe due to the close-in phase noise of the synthesizer.
Now, if I got a little bit confusing with my explanation, I'll get to the point. To remove the MW attenuator, remove R171 and R173 (270 Ohms), and replace R172 (18 Ohms) with either a zero Ohm resistor short that connection point pad that is supposed to bypass the attenuator (it really does not, unless you remove R171 and R173). Next, change R174 (10 Ohms) to a 100 Ohm resistor. Finally, add a 1mH surface mount choke across the point where R171 was connected.
This is to provide the DC return path for the switching diode. You could use a leaded choke, but the main thing is to keep the leads as short as possible.
On a final note, I must caution anybody that these parts are relatively small; were are talking about 0603 (.06 by .03 inch) parts. You really need to have some sort of magnifier or stereo mircoscope of close up reading glasses to do this job. Also, you need a good soldering iron with a small tip, such as a Pace, Metcal, or Hayco soldering station to do the job. The reason for this is that you need to be able to concentrate the heat in a very small area. If anybody has any questions, feel free to

give me a shout, and I will walk you through the job.

Pete gianakopoulos
Chicago, Il.

Addition by Rado:

Well, the procedure is not very simple. I expect a substantial effect if either R171 or R173 is removed together with the shortening of the pad. This will increase the resistance to ground from 135 Ohms to 270 Ohms.

Best regards,

Rado

578. S-Meter readings and S-Meter Level

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-05-29 04:40:11 UTC
From: autotest@optusnet.com.au
Topic: 578 Message: 578

Hi all,

Borrowed a R75 and think it is great, but one problem with this type of receiver is the coarseness of the S-Meter which is not always that useful for tuning right on a frequency when the frequency is unknown. Most of the time we guess that the station will be on a 0 or 5kHz division for SW broadcasters or we use our ears.

I have been messing with some VB code to look at the Signal Level which seems to go from 0 to 255, the manual does not say.

The question is how does this number being sent by the R75 relate to the S-Meter reading?

What exactly is the number saying it is a measurment of

I am assuming the the meter has a logarithmic scale so what is the the logarithmic base is is common (base 10) or natural (base 2.7182818) or something else.

Question 2.

Talking to and reading from the R75 at 19,200 baud is a slow process. Anyone know how to speed it up or tricks?

I am fairly new to the R75 but thanks to all those who answered question to others in the posts as I was able to learn a great deal

regards

David Brown
Sydney, Australia

I know the S-Meter

The best way to get "right on" frequency is to switch
to one or the other sideband and zero-beat the signal;
that is, tune until the voice/music sound is
absolutely clear and the carrier tone disappears to
zero hertz. Then, if your receiver is properly
aligned, the frequency you read is the frequency of
the station. I can hardly imagine a common s-meter on
any radio being able to discern the max signal to the
nearest 0.1 khz as well as this method.

You probably knew this, but for the record...

Hi,

Got the 3.3 at 455kc, wondering which is best for the last filter for listening to CW and psk31 and amtor and hf packet etc, 500 or 350kc?

And I wonder why at universalradio and elsewhere the 350 filter is cheaper than the 500hz by $15 or so?

Thanks for any help,

Mike

Hi,

Looking at PSK31 and CW signals they are both very narrow modes the 300hz would allow you to pick more signals from crowded bands. If you want to look at wider signals etc then I would use the 500hz (Navtec etc). You can calculate the bandwidth for a signal by its baudspeed (too hard for me to rem right now!) But I think 100Bd @ 170hz is 320hz??? Something along those lines.

I would head for the 300hz filter but it is worth if you can find the details check the skirts of either filter and see which has the better shape factor.

Hi David & Bruce,

I remember seeing a software (think it was for TenTec RX320) which does a software aided ECSS. The software first tunes for example 100 Hz below the frequency of the station using USB mode. Then using the soundcard it measures precisely the frequency of the carrier (audio frequency of the beat) and tunes the receiver spot-on using SSB mode. R75 with its high stability and 1 Hz tuning is perfect for such kind of application. The thing is - somebody has to have the time and enthusiasm to write the soft.
About the search for station - it can be done in the same manner. Search for carriers with the receiver in SSB mode and soundcard. Then one can log precise carrier frequencies and signal strengths.
Once I was thinking of something like "auto-dx software":
Using ILG database scan number of frequencies (in SSB mode with narrow filter ... or shrunk passband) and automatically log the carrier strengths. The carrier strength is measured by combining the S-meter level and the level of the carrier peak measured through the soundcard (and FFT software procedures). Proper calibration could be done. The result will be absolute carrier level logged for time/frequency. Some simple AI can check and sort the catches by DX value. Record audio from the worthy catches ... etc. etc. Propagation prediction could also be included in the algorithm. The result will be a pretty nice DX-bot. :-) Maybe they have such things in the spy/comm/govt/mil monitoring centers.

Best regards,

Rado

I know, and use sporadically a program packet called ITSHF that includes
HFREC , VOACAP and ICEPAC set of programs and subpprograms
Tey are a little old programs (95) whih can not only analyze HF propagation but
also can make footprints of a radio signal providing that power and antenna
system is known
Very good packet and though the original cost is abt USD 600 for VOACAP the
demo operates without any problem in any PC providing that at least PENTUIM
100 MHz /64MB RAM is at least used.

Except the preivious mesage, is the any prgoram with the help of the controller than can log the signal strength for a given time?

Also has any one trid to use an audio program to track signal level changes (F or QSB) via a soundblaster? [using a beat tone]

See my ideas in www.geocities.com/zliangas/sinpfemo.htm

Question - does the combo of Synch AM and the PBT engaged as described effectively equal SSB-selectable AM-Synch? Or is it significantly different?

Thanks,
Bruce Jensen

586. R75 For Sale--Loaded!

Yahoo group: icomr75 (2000 — 2002)

If anyone in this newsgroup is considering the purchase of an R75, I have one in excellent condition, for sale. Purchased new at the end of December, 2000. Has full complement of Icom options--UT106 DSP, UT102 voice synthesizer, FL-223 (1.9KHz) and FL-257 (3.3KHz) filters. Unit also has AGC mod, level-one MW mod, and the synchronous detector WORKS.

Must sell due to urgent medical circumstances. Non-smoker. AC supply never used. Includes all packing, cartons (even for options!), and manuals. I have invested over $870 in this receiver PLUS mods, shipping, etc. I will sell it for $645 and ship it anywhere within the continental US, fully insured for buyer protection.

That's cheaper than ANYONE is selling it for new, when all options are purchased.

Thanks for reading this post!

That's a good question. The AR7030 works slimilar to the R75 in that one uses the AM sync mode in combination with the passsband shift control. Passport to World Band Radio says the AR7030 has "synchronous selectable sideband". If we were to accept Passport's definition (whatever it is), then in fairness we must also say that the R75 has synchronous selectable sideband (that is, when the sync in the R75 is "fixed" and a narrow filter is installed at the 450 kHz IF point). Nonetheless, I'd be interested in knowing just how those rigs with a single button to select a particular sideband in synchronous mode actually differ from the R75 and AR7030. Do these rigs merely shift the passband automatically so the operator doesn't have to do it manually?

Topic: 501 Message: 590

Hi Michael and group,

I have not seen a definition of sideband selectable synch. but I think neither R75 nor AR7300 have true sideband selectable synch. detector (SSSD). The radios by SONY (ICF-2010, ICF-7600G/GR, ICF-SW07) have "true" SSSD is a way that they use phasing method for sideband extraction. This method consists of phasing the signals from the in-phase and the quadrature-phase detectors and produces about 30-40 dB attenuation of the opposite sideband. The cut of the other sideband is razor sharp (like a DSP or a very steep skirt filter). The bad news is that this detection is outside of the AGC loop (at least on my ICF-SW07) so in many occasions one also needs to de-tune away from the offending signal by 1-2 kHz in order to also shift the IF filter passband.
I'll try to explain this in more details. The AGC takes the signal after the 455 kHz IF filter. This signal has bandwidth equal to the 455kHz filter - let's say 4kHz. In other words it is about 2kHz on each side of the "BFO" (455 kHz local oscillator used in the in-phase and quadrature-phase detectors). The phasing SSB/SSSD detector takes the 455 kHz IF signal, performs the phasing and produces audio by one of the sidebands (attenuates the other) - if the BFO is at 455 kHz (in the middle of the 455kHz IF filter) then the audio bandwidth will be 2kHz. If one de-tunes by 1 kHz then for example the station carrier moves from 455kHz to 454 kHz. The phase locking loop locks the BFO to the new carrier frequency - 454kHz. The result is that if you choose USB-SSSD the audio bandwidth will be 3kHz (from 454kHz to 455+2=457kHz) - for LSB-SSSD the audio bandwidth will be 1kHz (from 454kHz to 455-2=453kHz).
The best synch. detector for me will be a one which does - phasing and allows for PB shift. The IC in R75 has in-phase and quadrature-phase outputs - so in theory it can be very easily combined with phase shifting network and provide "true" synch. detector (with phasing opposite sideband attenuation). The problem is - this phase shifting network IC is produced by SONY and not being sold as a component (only used in their radios). If one wants to build such network - it will be bulky and also requires high precision resistors and capacitors.

Sorry for the long post - hope it makes any sense (English is not my native language).

For further reading on synch. detectors check:
http://users.netonecom.net/~swordman/Radio/ShortWaveRadio.htm
That's Dough's page who kindly provided an article on synch. detector based on MC13022 (same IC as in R75).

Best regards,

Rado

Passport to World Band Radio says the AR7030 has
"synchronous selectable sideband". If we were to
accept Passport's definition (whatever it is), then
in fairness we must also say that the R75 has
synchronous selectable sideband (that is, when the
sync in the R75 is "fixed" and a narrow filter is
installed at the 450 kHz IF point). Nonetheless, I'd
be interested in knowing just how those rigs with a
single button to select a particular sideband in
synchronous mode actually differ from the R75 and
AR7030. Do these rigs merely shift the passband
automatically so the operator doesn't have to do it
manually? <

Thanks very much, Michael and Rado, for your answers -
as always, it is very illuminating, and Rado's tech
discussions are fascinating. It sounds to me like the
R75 does NOT have SS-SAM, but it also sounds like the
combination Michael mentions and discusses might
effectively duplicates the feature.

I have always felt that SS-SAM was perhaps just
another subtle way of duplicating, admittedly with a
switch flick as opposed to "tedious" twidding of knobs
;-), the ability to isolate and stabilize a signal.
It would seem that if a double-sideband SAM could be
forced to use just one sideband by reducing the other
to insignificance via PBT or another means, it would
provide roughly the same benefit.

I have an R75 in transit as we speak - I can't wait to
try these things out! (Gotta get those Kiwa mods
though :-)

From: mfcmerced@aol.com
Topic: 592 Message: 592

I've had my R-75 just shy of a month and am enjoying it immensely. My biggest trouble is I haven't had as much time to play with it as I would like.
I have read through all 591 messages on the list, and found it to be extremely helpful and answered a number of questions. I even created my own handbook from the posts. However, in reading through everything, I wonder if anyone has a checklist on how to make sure your R-75 is up to snuff. I noticed some people had problems with the clock being way off, some others had trouble with the signal strength differences while switching between USB and LSB. anything else we should be looking for? nobody wants to spend this kind of time and find they have a lemon lurking in the shack. (Where is Consumer Reports when you need them? I've read the other reviews on it...)
Also, when I read the Radio Netherlands review, I noticed how Tom had his East Coast reference stations to test signal strength. Does any West Coast listener have some suggested reference signals to test my R-75?
Thanks.
Mike

595. Just got my R75...very early impressions

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-06-07 21:43:01 UTC
From: bpnjensen@yahoo.com
Topic: 595 Message: 595

Hi, all - just got an R75 and hooked it up. Here are some first impressions...

The radio looks great, and the controls feel great. Smooth, positive feel to everything.

The front speaker sounds terrible. Good quality headphones improve this somewhat, but not hi-fi by any means.

It does not at first blush seem as sensitive as my Yaesu FRG-100, except maybe with the preamp-2 on; but I need to wait for tonight when the bands start hopping to try out some regular stations and see what happens.

As noted by just about everyone except ICOM, the AGC and the S-AM scarcely work, although they do work *a little.* They definitely need some mods, and next time I rustle another $150 that's what I'll do (if I still have this radio).

The RF gain is very peculiar. This is the only radio I've seen where the s-meter RISES when the RF gain is turned down. Is this normal? Also, the s-meter seems to shut off entirely when the AGC is switched off, and then rises only when the RF gain is dropped. Can't figure that one out. AGC shutoff also sometimes initiates unintelligible audio on stronger stations - any idea why?

Sometimes, for no reason I can determine, the s-meter gets stuck on the last high value, even when I do not have the s-metter set on peak. Another quirk.

The DSP-NR definitely makes a difference on some kinds of noise, but not a lot on all the types of artificial noise I have near my location. The NB seems to have no effect either, but it may work better on car ignition noise (which doesn't bother me much here). I haven't found a real heterodyne yet, so I can't say yet about the ANF.

The filters confound me a bit. The AM and SSB seem to have settings for W, N, and nothing. Each sounds a bit different. The wide (12 kHz?) and nothing settings drop off fast at literally at exactly 6 kHz from the center frequency; the narrow filter (is this 6 kHz?) is rather muffled sounding, and seems to drop off much sooner. It is far less pleasant to listen to than either the 4 or the 6 kHz filter on my Yaesu, which sounds better overall. I haven't yet taken enough time to set all the filters the way I'd like (the instructions do not seem very clear in this regard, so it may take me awhile), so maybe I'll have more success after I figure these out.

The 3 settings for the RF/SQU seem to make absolutely no difference in the operation of the knob. The practical function is identical on all three settings, at least on this radio.

The grounding "lug" in back won't accept a reasonably-sized ground wire, which is lamentable - now I need to solder a smaller wire onto my groundwire to be able to provide a hookup. No big deal, but for a communications receiver this seems like a given.

Obviously I'll need to check it out more - but I have to say that, after using the FRG-100, *early model*, I am not all that impressed yet. I will give it some time, but I'm really wondering if I made a good decision here.

Hi Bruce,

Congratulations on the new radio!
Now on the questions:

> The front speaker sounds terrible. Good quality headphones improve
> this somewhat, but not hi-fi by any means.

Connect a large external speaker. The internal is good only for speech.

> It does not at first blush seem as sensitive as my Yaesu FRG-100,
> except maybe with the preamp-2 on; but I need to wait for tonight when
> the bands start hopping to try out some regular stations and see what
> happens.

What kind of antenna do you use?

> As noted by just about everyone except ICOM, the AGC and the S-AM
> scarcely work, although they do work *a little.* They definitely need
> some mods, and next time I rustle another $150 that's what I'll do
> (if I still have this radio).

If you are a listener - this is a must.

> The RF gain is very peculiar. This is the only radio I've seen where
> the s-meter RISES when the RF gain is turned down. Is this normal?
> Also, the s-meter seems to shut off entirely when the AGC is switched
> off, and then rises only when the RF gain is dropped. Can't figure
> that one out. AGC shutoff also sometimes initiates unintelligible
> audio on stronger stations - any idea why?

The RF gain control sets the AGC floor (AGC voltage cannot go above a
certain level, Q1051 on the MAIN UNIT(2) schematic). Because the S-meter
level is derived from the AGC voltage it stars to indicate something when
you reduce the RF gain (the voltage on the AGC line is changed by the RF
gain). This I think is more convenient than peculiar. In some radios the RF
gain is in the front end and does not act on the AGC line directly.
Because the S-meter measures the AGC line level when you shut off the AGC it
won't indicate anything (the AGC voltage is constant). When the AGC is off
you should use the RF gain on stronger stations - otherwise the IF stages
are overloaded. The function of the AGC is to control the gain in a way that
the signal level to be in the working range of the IF stages. When the AGC
is off the receiver is fully "open" - the gain is at maximum. Any receiver
will overload on strong stations with the AGC off.
Here is how I use the RF gain. If a station is fading very rapidly making it
unintelligible I reduce the RF gain until the S-meter just "covers" the
station level. This helps a lot. Also on SSB transmissions sometimes I

prefer to reduce the RF gain in order to avoid the noise between the transmissions.

> Sometimes, for no reason I can determine, the s-meter gets stuck on
> the last high value, even when I do not have the s-meter set on peak.
> Another quirk.

This sounds strange - what exactly you mean by "stuck"?

> The DSP-NR definitely makes a difference on some kinds of noise, but

> better on car ignition noise (which doesn't bother me much here). I
> haven't found a real heterodyne yet, so I can't say yet about the ANF.

The NB works very well on static crashes.
ANF also works well.

> Obviously I'll need to check it out more - but I have to say that,
> after using the FRG-100, *early model*, I am not all that impressed

> good decision here.

That's the way I felt when I first obtained my R75. I couldn't comfortably listen to shortwave AM stations, and adjusting the RF gain to compensate for turning the AGC off still didn't improve matters (or make them worse). You really need the mods for comfortable AM listening.

The front speaker is optimized for voice, which is great for intelligibility -- if you want to hear a full range of sound, you must hook up an external speaker.

It takes a little time to get used to the radio and to set it up to your liking. After you've had some time to test the features of the radio, I think you may grow to like it.

I'll try this, although I tend to do most listening on
headphones anyway.

> What kind of antenna do you use?

I have a DX-Ultra, center height about 25 feet. It
works wonders on the Yaesu. I may have hit a period
when propagation was naturally low, because last night
reception was generally about as strong as I normally
get on my Yaesu, at least with preamp 1 on. Sometimes
I had to pop in the annenuator, something I rarely do
on the Yaesu.

I also have an MFJ-1026 noise canceller with active
antenna, which has good points as well drawbacks,
which I always have online, if not always operating.
I intend to attach another aux antenna to this thing
soon for hopefully better noise reduction.

> When the AGC is off you should use the RF gain on
stronger stations - otherwise the IF stages are
overloaded.<

Makes sense based on what I've observed.

> Here is how I use the RF gain. If a station is
> fading very rapidly making it unintelligible I
reduce the RF gain until the S-meter just "covers" the
station level. This helps a lot.<

I have heard of this trick before, and I tried it last
night several times. It worked fabulously! I also
turned off the AGC when I did this, and the station
fading cleared right up for a clean signal. Very

impressive.

> > Sometimes, for no reason I can determine, the

This happened yesterday afternoon for some reason - it behaved as though it was set to maintain the peak reading after the peak had gone by. It did not do this last night; it may have been operator error <blush>.

> The NB works very well on static crashes.
> ANF also works well.

I also found that the NB works extremely well when big trucks go by, and interestingly works the best in SSB mode - it totally obliterates the noise. The ANF finally proved its mettle last night on any number of weird squeals and hets.

599. Good antenna for R75?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-06-12 01:40:15 UTC
From: spock9999@yahoo.com
Topic: 599 Message: 599

Hi.

I recently got the R75. Nice receiver.

I already had a Uniden BC895xlt scanner with a good all-band discone antenna on the roof.

I have the discone antenna hooked up to antenna input #1 (50 ohm) and a long-wire antenna on antenna input #2 (300 ohm).

Frankly, the discone antenna outperforms the long-wire antenna big time. Even on low freqs.

The long-wire gives WAY too much noise. One guy suggested that I use 30' of coax with the shield hooked up to the ground terminal and the center hooked up to the 300ohm antenna in. THEN at the end of the 30' of coax, hook up the long-wire antenna to the center conductor. This way it will shield it for a ways to help get rid of the noise. That did seem to help, but I still get way too much noise.

I'm looking for a good antenna that will really pull in the freqs without hindering them with noise.

I live in an apartment too, so I'm a little limited when it comes to these huge outdoor 80' antennas. hehe.

I appreciate any suggestions.

Thanks a lot.

-Spock

Hi Spock,

The idea with the coax feed is nice but this alone is not enough. Several things:
1. The coax is 50 Ohms so it is always better to use a 9:1 balun (500Ohms to 50Ohms transformer) between the coax and the wire
2. The balun will also help with the common mode noise transfer from the coax shield to the wire (the coax goes through the house and picks a lot of noise). Grounding (ground rod) the earth terminals of the balun will help a lot.
3. grounding the coax shield at the point it leaves the house will also reduce the noise.

Check out the design shown at the Wellbrook site:
http://www.wellbrook.uk.com/longwire.html

They advertise their balun and isolator but both are very easy to construct yourself.

I'm currently trying to construct something like their active loop:
http://www.wellbrook.uk.com/ALA1530.html

The results are great - very low noise compared to the active whips I have. The phasing unit (a prototype yet) finishes the job of noise removal. In my apartment phasing the loop against a whip shows better results than phasing two whips.

Best regards,

Rado

Spock, For a ready-made low noise, broadband antenna the T2FD (Tilted Twinn Folded Dipole) from RF Systems in Holland is good. 3MHz to about 25MHz. It is 15m long and is mounted at an angle so it takes only about 10m of horizontal space. Also, you can make your own (just search the 'net for T2FD) but unless you have the ability to design the centre balun for a flat response from 3 to 25MHz then it will be a bit longer than 15m. ciao Ian J ----- Original Message ----- From: spock9999@... Is this anything like a magnetic loop antenna? Magnetic loops seem to be great for small spaces, but look like a total pain to tune and change frequencies due to their very high Q (even putting your hand near it to tune the capacitor changes the resonant frequency).

603. R75 For Sale--Price Reduced!

Yahoo group: icomr75 (2000 — 2002)

The R75 I had listed in an earlier post has been reduced. This receiver is complete with two optional filters FL-257 and FL-223, DSP UT-106 and Voice Synthesizer UT-102 modules. This receiver is in excellent condition, non-smoker ownership, purchased new in late December 2000. Synchronous AM works! Must sell, or it will be put up on an auction site. Anyone contemplating purchasing an R75, or knowing someone who would like to do so, please note! This receiver is available for far less than its cost to me, and includes all options listed above. Cartons, manual, packing, the works!

$500 plus actual shipping cost, insured. I am not working at this time, due to post-surgical temporary disability, and must sell! The cheapest this receiver (new) that I've seen is around $500-550, and that did not include any options!

Thanks!

I am using ALA1530. It works fine. It is an outdoors model, made of aluminium tube, and it does not need any tuning. I have placed it in the garden 12 meter from the house (2 meters from the ground). Being far from in-house interference, it is very quiet. It is broadband (150 kHz - 30 000 kHz). The handicap is that I don't have a rotor. I had one, but it didn't work, so I sent it back to the shop. If I want to use directionality, I have to go to the garden and turn it manually. It is directional only on LW, MW and in some measure on tropical bands. This particular model has attenuation on LW. I wanted it because I live close to powerful LW station (RTL). On higher frequencies it is normally quieter than my longwire (25 meters, 5 - 7 meters from the ground).

Hmmm,

Is this a "watch out" for this radio or "watch out" for the seller? No offence to anyone but "I am not working at this time, due to post-surgical temporary disability" always tends to scare some people for some odd reason - I would if selling leave this out IMHO.

And if this is a "watch out - bad seller" can you at least post why, examples, flames etc rather than 1 line that could mean anything ....

Steve

RE: If your discone is outperforming the hi-z longwire, it can be
the result of one or more factors, which may include:
a) Insufficient wire length;
b) Top wire or downlead proximity to noise-generating source;
c) Poor RF ground at the black terminal next to the hi-z terminal;

d) Poor ground at the receiver's main ground lug;
e) SERIOUS impedance mismatch;
f) Losses in the downlead (improved by shielding via coaxial cable with a good ground at the shield connection point);

I have had great success with an Alpha Delta DX-SWL (60') sloper. This antenna uses a shielded coaxial cable downlead, grounded at both ends.

Lori,

I thought that I would let you know that while your advice
was correct and I did proceed carefully, I bought the radio
from Danny, it arrived today, and, if anything, he was
conservative in his description of it. While I checked his
rating on eBay and looked for any bad news via dejanews, I
also noted that Danny gave me a home address and phone
number and was willing to ship COD, even declining my offer
to advance shipping costs.

The radio is in absolutely perfect condition, with all of
the additions he advertised, but, more importantly, I found
Danny to be a very decent fellow who even included a photo
of himself and his listening post. His need for funds was
very real as evinced by his paying the extra cost for
express mail shipping out of his own pocket.

Again, your advice of caution was well given -- but Danny
turns out to be guilty only of telling it like it is.

Thank you all for your responses! They are very helpful.

Seems like antennas for 100khz - 30mhz are a little tricky and need
to be somewhat large.

I'll let you know what I decide to go with and how it performs.

Thanks again!

-Spock

613. Data Slicer ?

Yahoo group: icomr75 (2000 — 2002)

Hi.

I do not have any R75, yet.

But if I want to have a big database on a PC,
maybe 1000 records, and select frequencies to
scan on the R75 without the need to decode any
signals, are there any simple programs out there
that can be used to achive this?

Anyone using the Icom RMS75? The Shoc and Radiocom
type of programs seems to be a bit overkill for me,
and unneccesary expensive.

Ubbe.

Hi Dean,

My interface (HPL041) is an increased version and improved of the Hamcomm interface, the input to the interface this designed for REC-OUT to the rx?s. I proved the R75 (REC-OUT) with the Radioraft interface and it works well. Do you have the program SLICER? with he, you can prove the correct operation of your interface.
Does somebody want the program?, it is very small and freeware.

Hi Everyone,

Can anyone help me re: Datong AD370 cables & connectors for the
indoor PSU, I would like to get this aerial up and running again.
Hope someone can help,
MTIA,

Best Regards,

William.

William-
The power plug is a 1/8" miniplug, tip positive. The coax connectors are available from Universal Radio, listed as KOK1 Grundig antenna plug (Order #0199).

620. Frequency off by about 15 Hz - any fix?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-06-29 22:02:03 UTC
From: Bruce Jensen
Topic: 620 Message: 620

Hi, all - my R75 freq readout seems to be off by about
10 - 15 hz, ON AVERAGE, across the bands (the zero
beat frequency readout for an AM station such as WWV
is about that much higher than the known frequency).
Any easy fixes for this? This may be a quibble, but
it's nice to have things ***PERFECT*** right? ;-)

Thanks,
Bruce Jensen

BUT--before you go tweaking anything, be sure of three things:

1) That you have the R75 up to its proper ambient operating temperature. In other words, let it warm up a good long time. If you try to adjust it "cold", you will only be chasing yourself.

2) Keep the cabinet as nearly-together as possible when you make the adjustment. It would be a good idea to familiarize yourself with the location of the component you plan to adjust in advance, so you won't waste any time when making the tweak. Again, this keeps the receiver in as nearly-normal a situation as possible. Work quickly and get out quickly.

3) Don't use a metal tool. Use the proper, non-conductive adjustment tool to do the job.

Be aware that R75's, just as many other receivers, will drift slightly as the ambient temperature builds (unless you have the TCXO installed). I found that my R75 eased down by about 20-30 Hz or so, but then remained solid and stable as a rock from that point onward.

Thanks, fellows, for the advice. I will let the
receiver run next time for an hour or so before taking
stock of the frequency discrepencies. It's not
something I cannot live with, mind you - I'm just
fussy sometimes.

I don't know if it was mentioned before, but you need to select a station you know is dead on and put the radio in SSB mode (unless you have a decent frequency counter) -- preferably a higher frequency station to ensure better calibration. Only the top cover of the radio needs to be removed. When putting the screw driver into L2, make sure the radio is off but when you have the driver in place turn the radio back on (I'm assuming that the radio has already been running for an hour). You need to keep the radio on while adjusting L2 -- don't be afraid to overshoot because you can turn it back -- until it sounds just right, that is LSB and USB should both sound the same. Before removing the driver, turn the radio off, just in case your clumsy. The R75 manual indicates the location of L2 -- there is a "can" without a top around the area where L2 is.

Yes, I am. No receiver is 100% perfect, and nor is the R75. But in general, I am very happy with it. I actually like it more than the AR7030 I owned a couple of years ago.

Best 73'
Mark Veldhuis.

of years ago.<

I wrote Tony a private note, but I thought I'd add
this -

One big reason that this group started is because R75
owners have found that this basically excellent
receiver is still not perfect, and sought to compare
notes and ideas on how it can be improved to a level
of excellence befitting its heritage and pricetag. To
that end, this group has done a splendid job - the
result has been innumerable helpful tips and the
establishment of some new wonderful mods that Kiwa has
agreed to perform professionally.

With my specific query, when you pay 100's of $$$ for
a radio with 1 Hz tuning capability and find that it
is 15 of those Hz off center, what is the use of
having that level of precision when you don't have
accuracy to match? The repair of such an error is a
valid concern (not a complaint, really), and perfectly
reasonable for this group.

Perhaps Tony is completely satisfied with his R75, and
joined this group to join in the lovefest - well, we
do that too, but there is much to be said for pursuing
excellence. Hey, Tony, you never know - you might
just find that the gripes we have here today will

result in your own radio performing better for you
tomorrow. So, live and let live eh?

Bruce Jensen

630. Q-Tek Cyclops Wire Antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-07-03 21:09:31 UTC
From: William Conlan
Topic: 630 Message: 630

Hi All,
RE Qtek cyclops wire antenna
has anyone bought and installed this ant, would be v.int to hear
results.
Mine is v.noisey but having attached an RF sys Balun and
Global
Atu, things ahave really picked up, although this does negate the
built in balun noise cancellor, any info.....
I have contacted Haydon and was told the rf in my are is probable
cause.
Most unhappy with the outcome from Haydon as they said send it back
buy we will have to re package and allow you less money than you paid
for it ,not much quarantee is it.
Nice when you enqiure but totally diff when you coimplain.

Is Mike Haydon still envolved.......
Thanks you lot, any info please,

Best Regards,

Bill SW Ireland.

635. poor S meter sensitivity

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-07-13 15:05:14 UTC
From: sratzlaf@flash.net
Topic: 635 Message: 635

Hi.
I've had my used R75 for a month or so now; I added 250Hz CW INRAD filters in both 9Mc and 455kc positions. I do mainly weak signal LF/beacon hunting with the radio, using the narrow filter, with some Papua New Guinea/Indonesian Tropical Band listening as well, using mainly LSB.
But in any mode/filter combination, I notice the S meter is pretty much worthless; it takes a strong signal with the preamp 1 activated to begin to get any S meter reading. I've learned to do without it now, since it never shows anything for the LF work. Using a signal generator I've measured the S0 level where the S meter just shows as about -70dBm, which is a pretty good-level signal. My AR-7030 starts showing S meter readings around -93dBm.

I wonder if anyone else has noticed whether their S meter is not as sensitive compared to whatever receiver the R75 replaced?

Overall, I really like the R75; in fact it's replaced my AR7030 for LF listening. The 7030 only had a 500Hz filter; having the 250 Hz filter really makes a difference for crowded beacon channels. And the R75 is much more sensitive than the 7030. I use Preamp 1 for LF listening and find I can hear quite a bit weaker signals than the 7030, even with its preamp on, could hear. I think for the price, the R75 is a tremendous receiver, warts and all. (I'm not getting rid of the 7030, though!)

I've considered doing the AMBCB attenuator mod, but my sensitivity tests of the R75 with a signal generator (HP8640B) show more than adequate sensitivity, especially with Preamp 1 on, for my listening needs. I'll leave the attenuator alone in my radio. I agree the AM mode leaves a lot to be desired; I rarely use it, preferring SSB; and of course the sync detector, as many others have found, does nothing. After experiencing real sync detector operation on the AR-7030, everything else comes up far short. But the R75 has one of the best noise blankers I've ever experienced, rivalling Drake's R8 series noise blanker and Yaesu'e old FRG-7700 noise blanker--truly superb. The 7030+ noise blanker does not begin to do anything on my rare times of local noise, whereas the R75's blanker completely removes all the noise. (I tried a Drake R8B for several weeks and found it worthless for my CW utility listening requirements, plus its LC filters had poor shape factors, letting lots of LF adjacent channel interference through. But the R8B did very well for Tropical Band listening.)

Well, it's true that the AR7030 consistently shows a higher S meter
reading than the R75 -- I always thought the AR7030 meter was useless
because I would get an S8 or S9 reading on a signal it was barely
picking up (at least in the lower frequencies) -- I guess it's a
matter of perspective.

> I wonder if anyone else has noticed whether their S meter is not as
> sensitive compared to whatever receiver the R75 replaced?

For what it's worth, I get the same S meter readings on the R75
with the preamp off as I do on the R8500.

Hi Steve,

As you have a signal generator you can try the factory alignment procedures.
They include an S-meter calibration. Or you can do only the S-meter calib.
You can find the instructions in the Files section of this group:

http://groups.yahoo.com/group/icomr75/files/Information/

If you try them tell us about the results.

Best regards,

Rado

Is this 103.5 dB DR at default setting or with Preamp 2 on at the low
end and ATT on at the high end?

Hi,
I haven't tried to do anything on my R75 other than check the MDS and when the agc activates. Since I have two sig gens, perhaps I should try a more realistic DR test with 20kHz or closer. When I do, I'll post my results. I only have 250Hz filters, so that will sort of make the results look better than for a 500Hz filter.

642. R75 dynamic range tests

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-07-17 03:01:06 UTC
From: sratzlaf@flash.net
Topic: 642 Message: 642

Hi.
I was motivated to try to obtain some two-tone dynamic range results.
The following was done with no preamp on, and with Preamp 1 on, at
3500kHz, at tone spacings of 20, 10, 5kHz, in CW mode using my INRAD
9Mc/455kc 250Hz filters. I used the ARRL method with the intermod
product observed at the MDS level. R75 s/n 01288, purchased used,
stock except for addition of 250Hz INRAD filters.

Preamp off
MDS -135dBm
20kc spacing, IMD at -38dBm, 135 - 38 = 97dB dynamic range

10kc spacing, IMD at -48dBm, 135 - 48 = 87dB DR

5kc spacing, IMD at -54dBm, 135 - 54 = 81dB DR

Preamp 1 on
MDS -143dBm
20kc spacing, IMD at -49dBm, 143 - 49 = 94dB DR

10kc spacing, IMD at -51.5dBm, 143 - 51.5 = 85.5dB DR

5kc spacing, IMD at -63dBm, 143 - 63 = 80dB DR

Test equipment consisted of two HP8640B signal generators; homemade
combiner with large cores, with about 40-45dB port to port isolation;
HP3400A true rms voltmeter.

This is the first time I've tried a 5kc spacing DR; the ARRL has
recently published some receiver tests done at the 5kc spacing--the
little Elecraft K2 kit transceiver was some 15-20dB better DR than any
other radio they tested, including fancy $3500. radios! See the note
on Elecraft's webpage, http://www.elecraft.com

644. DR R-75

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-07-17 06:06:41 UTC
From: gert_nilsson2002@yahoo.se
Topic: 644 Message: 644

The complete data from Icom Europe is as follows:

Preamplifier 1 on 14 MHz 100 kHz spacing 500 kHz filters:
103,5 dB + 16dBM IP3

Preamplifiers off

104,5 dB + 22 dBm

They also have a chart of the sensitivity:
(SSB presumed?)

0,2 - 1,6 MHz 0,5 uV
1,6 - 0,1 uV

645. Re: [icomr75] DR R-75

> 0,2 - 1,6 MHz 0,5 uV
> 1,6 - 0,1 uV
>

My instruction manual shows the following figures :
0.1 - 1.8 2.0 uV (SSB, preamp OFF, 10dB S/N)
1.8 - 29.9 0.16 uV (SSB, preamp 1 ON)

Why such a difference below 1.8 MHz ?

Topic: 644 Message: 646

Hello,

Because the R-75, like most communications receivers, has
the BCB portion and below desensitized to avoid problems
with IP3. It's a "time honored" practice despite the availablity
of superior front end devices.

Some receivers such as the AR7030 and the R-390 have
full BCB sensitiviity (and IP3 specs to allow it).

Best regards,

Paul Bigelow

647. 530-1700 MW-AM

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-07-24 03:38:28 UTC
From: G.I. Joe
Topic: 647 Message: 647

I know we rarely talk actual performance on stations and what we hear here but I got the answer to my questions about MW - AM 530-1700 kHz performance on a stock R-75 with dsp UT-106
I logged over 80 stations in 4 days, most during the day!(I am still IDing them) There still is more and a whole new world at night. Using a discone RS all band scanner antenna on a mast slightly above my chimney (single floor dwelling) with whole lotta coax drapped across the deck, I also got similar performance but not as clean with the radio shack bare wire stretched the length of the roof and about 5 feet above it with a short slopped run into whole bunch of coax dragged across the yard (not sure I like either and don't want to hack a lot of coax yet, its only been like this a year or so or in other words 'I'll be damned if I am going to crawl into a hot Texas attic for some time to come')
I bought a RS (Radio Shack) AM loop and am not really sure whether it helps or not yet as the its designed for internal am antennae but I did log a few more today that I didn't find before. If I plug it in to the PL 258 antennae input instead of an any other antennae, I can tell by turning the tuning knob it does work but poorly compared to any other antennae. I would like to know if anyone has compared the RS loop to the Terk loop. As i could still use one for my ATS 909/DX 398?

648. Question about KIWA mods...

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-02 17:38:54 UTC
From: Bruce Jensen
Topic: 648 Message: 648

Hi, all - I would like to the get the KIWA mods soon. However, my understanding of those mods for the filters is removal of the 15kHz filter, popping the 6 in it's place, and putting the 3.8 where the 6 used to be. By my reckoning, that still leaves a spare 455 kHz filter space open. It also leaves a 15kHz filter without a home.

I would like to retain the 15kHz filter for use on FM. Is there any reason why the 15kHz could not be reinserted and reassigned in the remaining spare filter slot?

Is there some reason why I would not want to do this?

Thanks,
Bruce Jensen

Topic: 648 Message: 649

Don't do it!
The swap, I mean. Get the wide AND the narrow filters and replace both while you are in the radio. The wide replacement is about 10kHz and keeps most of the fidelity for AM MW BCB stations and really helps reduce the heterodyne "whistle" if two shortwave stations are close together, but you'll still hear good sound. The narrow filter is the more difficult one to swap, the wide filter replacement is a drop in replacement. If you put the stock narrow filter in the wide slot you now have a good narrow filtered sound, and a mushy narrow filtered sound and no more good fidelity sound.
If you have to get just one filter, get the narrow filter, replace just the narrow filter leaving the wide filter as is and wait until you can afford the wide replacement. If you get both at once, I think you'll save a few dollars also.
I bought my 2010 used and the previous owner did the conventional replacement and swap. While the narrow filter worked really well, the "wide" setting with the stock narrow filter sounded pretty lousy. Later, I got the wide Kiwa replacement and it really improved the sound.

Yeah - I was taken aback (not to mention confused) by
your comments, until I read that 2010 reference at the
bottom - then it struck me that you're in the realm of
multiple radios, and in the dark the little displays
all look the same ;-)

Hi everyone,

I have the IC-R75 and was wondering if anyone can tell me the best setting to have it on for USB. I have tried changing the diff settings from the menu but dont know which is right or wrong. I dont have the DSP unit fitted as yet so will my fiddeling with the filter setting be in vain untill the DSP unit is fitted or what.
Any info greatly appreciated,

Best Regards,

Bill.

p.s. Yes I have a manual but it dosnt go into any great detail
p.s. Will the addition of the DSP unit make a wonderous difference or will i hardly notice!

That's true. Remember however that the 6kHz and 15kHz fixed filters are at 450kHz!

> I would like to retain the 15kHz filter for use on FM.
> Is there any reason why the 15kHz could not be
> reinserted and reassigned in the remaining spare
> filter slot?

The reason for this is above.
The filter in the "optional filter slot" should be 455 kHz i.e. it could not be used for synchronous AM. This is why the filter mod exists (and also many people like me do not use FM ... we don't need the 15kHz filter).
The design by Icom to have two 3-rd IFs (455 and 450kHz) is strange - they could have made everything to use 455.

Best regards,

Rado

I don't know exactly what the EXP is doing (mine is always ON). I think it
allows for more 2nd/3rd IF filter combinations.

A lot of information (schematics, alignment procedures etc.) you can find in
the Files section of this group.
The link is:

http://groups.yahoo.com/group/icomr75/files

Best regards,

Rado

The 6 seems to be a rather wide 6. FM sounds OK with it -- best to
turn off the AGC though.

To my understanding, the EXP oN allows one to choose from the optional
filters (oP1 or oP2) in addition to the stock filters when selecting
filter combinations for the wide, narrow, and normal settings.

By the way, I was wondering if someone here have seen any diferenrence when using Expanded Filter Selection On or Off? I installed two optional filters, FL-103 and FL-257, and settings works fine whatever I turn EXP On or Off. The manual does not explain this function...

Indeed, thank you, now I understand. Better yet, they
could have simply put in a 6 and 4 for the AM modes
and put in the 15 for FM and just have been done with
it. Oh well - nothing's perfect.

I recall that you mentioned this before - and I tried
this suggestion, with the net result that the FM
sounded fairly muffled. One would think that even with
FM, 6kHz width (especially if it is wider or has
shallow skirts) would be sufficient? Maybe I had a
setting wrong? I will give it a try again...thanks!

I tried it again on my R75 -- it works as I described below.

Even with the EXP oFF, I can set the optional filters for FL-103 or
FL-257 but I cannot then select these filters for use when choosing
filter combinations for the different modes.

I've got cordless phones coming in loud and clear. However, the 6
metre band and CB is dead here. I cannot find anything else on FM at
the moment. Perhaps you need to adjust the displayed frequency a
little bit? -- you cannot afford to be too much off frequency with the
6 KHz filter and FM.

I've tried this:

http://www.radiohc.org/Distributions/Dxers/broomstick.html

and it works quite well for both receiveing and transmitting with a homebrewed PI network tuner (you really don't need a tuner for receiveing unless you are getting strong overload from a nearby station). However, it does not beat my wire antenna, which is simply about 100 feet of wire stapled along the eve of my house and thrown over the roof top to the other side. Up to a point, longer and higher is better, but anything is better than nothing. I'll tell you what, the R-75 is better at receiveing than many ham tranceivers. If listening is what you want, it is hard to beat and probably the best receiver you can buy until you get to the $1000+ class.

Have fun,
Roy

Here's the link to the PI network tuner and a bunch of other
inexpensive projects that actually work:

http://www.radiohc.org/Distributions/arnie.html

Click on the "easy to build PI-network antenna tuner".

I built mine just like the instruction, out of enameled magnet wire
wrapped around a piece of PVC tubing with a rotary switch to select
the taps. The hardest part was finding air variable capacitors.
Luckily, I found a couple at a local hamswap for $8 a piece (I
thought it was a little expensive until I did a web search and saw
that they are often 5-10 times more expensive if bought new). The
best way to get these is to find an old vacuum tube radio at a junk
shop, thrift store, or garage sale and grab the variable capacitor
that is used for the frequency tuner. After wiring it all up and
adding knobs, it all fit into a plastic project box about 6"x6"x3".
I didn't think it made all that much difference in reception, but
after I got my ham license, I found that it worked great as a tuner
for my transmitter. I easily can use it at 100 watts and it tunes up
any of the ham bands.

I would first try the R-75 with as long a wire as possible by
itself. With the built in preamp, you should have no problem picking
up just about anything. The real advantage of the tuner is that it
helps eliminate strong signals outside of where you are tuned and
helps prevent overload, which I don't get anyway.

Hi list,
I have a Murata ceramic filter CFS455J (about 3 kHz), is it possible to install this filter in the optional filter slot in R-75.
Any problems in matching the filter with impedances etc. ?

Jarmo

No problems. I have tested this filter before I bought the 3,3 kHz ICOM filter. My filter had a bandwidth closer to 4 kHz.

From: gert_nilsson2002@yahoo.se
Topic: 671 Message: 671

Just bought a 6 kHz filter for the 9 MHz IF to replace the original 15 kHz 2 pole filter just ahead of the noiseblanker. This is an original ICOM part called 9M6A1 used in transceivers. I have to loosen all screws and some ribbon cables to be able to desolder the old filter. I am not quite sure how to loosen the ribbon cables. Help needed!

I hope this 6 kHz filter with give the receiver a better close in dynamic range, however the blanking of fast noise pulses perhaps will suffer. Just have to try....

672. IC 775 filters for the R75

I mostly listen to Spy number stations. They are fun to catch and since you are in Europe you are in a good position to catch some of the more interesting ones. Have a look at www.spynumbers.com for more details.

I also use mine to tune into and decode HF-FAX like weather charts using my computer. Have a look at www.hffax.de for more info there.

THere are also a number of military frequencies programed into mine. Look around for some local frequencies. I have heard UK milcom here in the USA.

Lastly I use mine to listen to broadcast Shortwave. Radio Australia, BBC and arabic language stations are my favourites. (I use the first two for news and the last for learning the language) Many radio magazines have lists of frequencies for shortwave broadcast stations.Try and pick up a copy of the book "Passport to World Band Radio" It is full of frequencies and there will not be a single night you can;t find an interesting station listed in this book that isn't hearable on the R75.

The thing about a receiver like the R-75 is you will often hear more white noise than signal. THis is not because the radio is bad (it certainly is not) just that the nature of most HF transmissions are they are short and infrequent and unpredictable (apart from Shortwave Broadcast of cause) So don't be disappointed if you find yourself often listening to nothing. This is not that unsual. The challenge and satisfaction is found in patience. Just tune around and see what you can get. Don;t stick to "known" frequencies. Spin that dial!

I hope you found this helpful.

Scott

I listen to utility stations such as aero, maritime, government, military, "spy numbers," and various other stations. Occasionally I'll listen to a broadcast station. I also use the R75 to listen to low-VHF skip. A few weeks ago I was picking up all sorts of fire dispatch comms on 33.900 MHZ.

One of the things I like most about the R75 is the ability to be controlled from a computer. I use my R75 to scan HF freqs for ALE, or Automatic Link Establishment, a digital signal used by various gov't & military stations to set up a voice link. I use the program PC-ALE for this, and it works quite well. I also use the RS-R75 software to search for voice communications. I've got numerous different frequency banks set up for different services. I've logged many, many more stations using the R75 & software than I did before I got it.

Best thing to do is turn on the radio & start spinning & grinning.

I listen on a ham radio vertical antenna. The best time to listen is during the middle of the day when the ionozation of the ionosphere is high.

Best way to check to see if the conditions are good is to listen to the 11 meter CB band or 10 meter amateur band. If you hear activity there, chances are you may hear some low band VHF.

> Mmm, thanks. What antenna are you using to receive the VHF skip? I have tried and tried to receive this type of signal, I switch between the longwire and the discone but with no success, maybe my timings bad so when is the best time to listen?
>

I listen on a ham radio vertical antenna. The best time to listen is during the middle of the day when the ionozation of the ionosphere is high.

Best way to check to see if the conditions are good is to listen to the 11 meter CB band or 10 meter amateur band. If you hear activity there, chances are you may hear some low band VHF.

679. Tom, can u elaborate on ALE?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-17 14:37:50 UTC
From: Rashad Mohamed
Topic: 679 Message: 679

Hi,
Returning to the hobby after a while -and I don't have an R-75 - not *yet* anyway ;-) - I've been coming across a few new acronyms - and one is ALE, that Tom mentioned in his post (msg 675 "re: What?")

What *is* ALE exactly and what does it sound like? I came across the acronym the other day on another site and did a search out of curiosity, but wasn't in the mood to sort out the needle in all the beer hits...

Is there a web site that explains or talks about it?

cheers
rashad

JVComm32 is one of the best to use. But you can get various apps for Winodws
but that does FAX and SSTV with many cool features!

ALE is Automatic Link Establishment as used by military and government stations, as well as other HF users worldwide. Basically it is a signal used to set up an HF link by testing propagation conditions between several different stations in an HF net. For a detailed explanation of this signal, go to http://www.wunclub.com/files/aleinfo.html.

To listen to a sample ALE signal, go to http://www.wunclub.com/sounds/index.html and click on ALE near the top of the list.

685. S-Meter calibration

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-22 17:06:04 UTC
From: aunumero13@aol.com
Topic: 685 Message: 685

Hi all,

I find the S-meter useless for signals below S9.
Does anyone know how to calibrate it ?
I've already read the "4-4 set mode adjustment". This allows to check
if we have S9 on the display when a SSG is set as 35µV for example
but not to modify the settings...

There must a Rxxx in the receiver to perform the mod ?

Tnx fer ur help.
Pat.

686. Digital signals?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-23 15:56:27 UTC
From: Tom Sevart
Topic: 686 Message: 686

Hi all,

Is anyone out there decoding digital signals such as RTTY, Sitor, etc (besides ALE) with their R75? I'm using my Kantronics KAM all-mode packet/RTTY TNC. Normally it's hooked up to my amateur transceiver but I've been experimenting with using the audio from the record out of the R75 to the TNC. So far I'm having mixed results using RTTY mode and wondering if I could do better using USB or LSB. I would like to hear from other digital monitors and what kinds of setups they're using.

Tom

Date: 2001-08-23 16:13:17 UTC
From: Steve J. Walker
Topic: 686 Message: 687

Tom,

What problems are you getting ? Rather than "not working" or just "nothing" can you be a little more specific. Normally for data modes you would want to use CW/RTTY that has a BFO offset so that if the decoder supports a CF of 1700 then you set the radio to -1700 for example then your freq would be spot on to the emmision CF so say a RTTY station on 17.380.0 would have to be decoded like shown other eise you need to retune to get the right display. CW on the ICOM should be 800hz RTTY modes can be low or high tones - either 1500/1700 or 2210 (depends)

Also note that some modes like ALE and PSK systems are using USB as the TX mode and as such you would tune to the nearest .0 to center the signal tones.

As you said it was working ok on your other system I suspect that you are feeding it using the line out? Maybe the level is too low or high for your decoder? Can you tune the same signal on your other RX and do a side by side test? Does it decode and the R75 does not? Also DON'T use the DSP when decoding this can confuse some decoders when faced with a DSP'ed signal.

But please post here with some more into and we will try and help.

> Tom,
>
> What problems are you getting ?

Actually I'm not having too many problems other than trying to find the right offset for decoding. It seems that when I use RTTY mode the pitch is too high and it's hard to get the mark/space frequencies right. And then sometimes it only prints garbage. Whether or not that's due to the decoder or not isn't clear.

I think it's just a matter of learning what the exact offset frequency is when using the RTTY mode with the 2125 Hz offset. I believe the KAM uses something like 2.3 kHz offset in RTTY mode. I know it's 2.2 kHz in SITOR mode. At any rate, I'm just trying to get all this sorted out so I can program the memory channels with the exact freq I will need to tune to for decoding.

690. Floor-wart improvements

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-24 02:52:48 UTC
From: Radostin Danev
Topic: 690 Message: 690

Hi R75-ers,

Just uploaded a small file describing improvements I made to the floor-wart.
First is adding bypass capacitors across the diodes of the rectifier. I
think there are places for such on the PCB but they are missing. Don't
remember well, I added bypasses to another floor-wart recently and I'm not
sure which had the places on the PCB. I think this removed the 60Hz hum I
had on some stations. (there are stations which transmit such hum so there
are still some).
In the summer here my floor-wart gets pretty hot so I broke all plastic
coverings on the air ventilation slits. Also drilled some additional holes.
This reduced the temperature.

Best regards,

Rado

Hi, Radostin - thanks for this; hum is something my
setup exhibits.

Not being much in the tech department, however, I was
wondering if you could tell us about how many caps one
needs to add for your mod. That would give a clue as
to what we can expect when we open the unit.

Thanks,
Bruce Jensen

Hi Bruce,

I added total of 6 caps. There are 4 diodes forming the rectifier. across each diode add a cap. Also add a cap between the two wires comming from the ransformer (this one has no effect maybe). Finally add a cap across the wires going to the receiver (there is a big electrolytic capacitor there already). All capacitors I used are 100 nF (0.1 uF) ceramic.

Best regards,

Rado

693. VHF converter?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-24 05:18:48 UTC
From: Tom Sevart
Topic: 693 Message: 693

Does anyone know if anybody is thinking about producing a VHF converter for the R75 to give it extended coverage in the VHF or possibly even UHF band? Say, something similar to the unit for the Kenwood R5000 or Drake R8B? I like the ability to tune up to 60 MHZ with the R75 but it would really be neat to turn it into a wideband receiver.

Tom

696. FL44 filter for the R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-25 21:00:02 UTC
From: gert_nilsson2002@yahoo.se
Topic: 696 Message: 696

Today I tested the FL44 2,4 kHz filter from my R71 in my new R75.
Fits perfectly. It makes a very good job. About the same bandwidth as
the original CFJ455K5. Perhaps I will try some sharper filters in the
CFJ455K series later on. The 1 and 2 kHz filters used in the AR7030
should be good substitutes.

697. RAC 2002 Natiional Convention!

From: Mike Roberts
Topic: 697 Message: 697

Hello All.

This email is to inform everyone of the upcomming
Radio Amateurs of Canada 2002 National Convention.
This even will be held July 26, 27, 28th of 2002 in
Vernon, British Columbia, Canada. For those who are
unfamiliar with RAC, it is the Canadian version of
ARRL. This event is the second ever put on, with the
first happening 5 years ago in Calgary, Alberta. It
was a major success. This event was one of the
largest amateur radio events EVER in Canada. This
upcomming convention will be the largest amateur radio
event over the last 5 years in Canada.

This is meant to inform radio amateurs who might be
interested in attending.

Additional Information is available online at

http://www.rac2002.org/

Please forward this email to anyone you know that
might be interested.

See you there,

Mike Roberts,

698. Filter calibration

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-08-29 19:20:03 UTC
From: jp@pp.inet.fi
Topic: 7 Message: 698

Few technical questions:
The service manual describes filter calibration for R75, has anyone tried this?

If the ANF and NR is not selected, is the audio signal going totally through pass the DSP unit or does it even then have some effect on the signal?

Any improvements to make the AGC more faster when listening AM signals on SSB mode?

Hi,

I found JVComm32 to be the best soft for SSTV and FAX. Get a demo version here:

http://www.jvcomm.de/

The demo is not limited in any way ... just puts some demo "stamp" on every received image.

Best regards,

Rado

Hi Folks,

Sorry if this has been covered before.

I've order an R75 and hope to have it but late September.

I know iCom are not famed for their software, and the PCR-1000
software is not Windows 2000 compliant with no plans to address this
issue by iCom I understand.

So what would anyone recommend for the R75?

Any tips form users would be appreciated.

Cheers.

Dougie,

I use the control software and like it fine. I
recently bought a new laptop and installed the R75
setup and discovered it won't run in 16 or 24 colors.

Subject: [icomr75] PC Control Software

Hi Folks,

Sorry if this has been covered before.

I've order an R75 and hope to have it but late September.

I know iCom are not famed for their software, and the PCR-1000
software is not Windows 2000 compliant with no plans to address this
issue by iCom I understand.

So what would anyone recommend for the R75?

Any tips form users would be appreciated.

Cheers.

Regards,

Dougie

Gert

Strange that you are not getting through via email -- I often correspond via email with Kiwa, including order placement.

I've been quite pleased with both products and shipping (many times they've quickly built up a product that wasn't in stock, such as
the braodcast band filters, etc).

They do have a phone number -- if your emails are getting lost on the internet, you can reach them at their USA phone number
509.453.5492
800.398.1146 (orders)
This is Pacific Standard Time zone.

I have no financial or other ties to Kiwa, just a satisfied customer!
Don Nelson

I can recommend you go for Smart Icom 32 by Fineware or ScanCat Gold from C.A.T. Both work great. The former comes with tons of accompanying frequencies, the latter will control every computer controllable radio out there. I have both & both are first class.

Stephen,

I have a MUCH older version of ScanCat that I use with my BC-895XLT scanner and, occasionally, my Icom R-8500. I also use Mark Fine's program.

I find that my older version of ScanCat uses far too many resources than I think is contemporarily necessary. I understand that ScanCat has recently upgraded their code to reduce unnecessary resource use.

I must say that without exception I have been EXTREMELY happy with FINEWARE, especially the ability to incorporate his "Schedules" program. Both allow me to not only control the R75, but assure that I have the most up-to-date shortwave information that is available at the click of a mouse.

My recommendation is SmartIcom 32.

I have no pecuniary interest in this program and am simply a very satisfied user.

I remain,

John Schneider, KB2COP

709. Advice needed on decoders

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-09-10 03:25:15 UTC
From: Ask me
Topic: 709 Message: 709

I am interested in digital monitoring and would like some advice on equipment and reference information. Does anyone use or have an opinion about the Universal M-450v1.5 or the MFJ-462B decoders? Also, any suggestions on a good tutorial on CW/Rtty etc would be helpful. I live in a mountain valley in western Montana, but I am hearing some Morse and the like. I can't believe everything I'm hearing now compared to my previous radio, a Sony 2010. The Sony is good to be sure, but my R75 really makes a difference. I finally feel like I have a serious radio. I managed to talk my landlord into letting me string a RF Systems Mini Windom antenna on the gable end of my second story apartment. At least it's outside. This group has been very helpful to a new guy like me. Thanks.

Jeff Monroe

Actually, I've been quite happy with Icom's RS-R75 program. I like it better than Smart Icom Control 32 since I find that it's easier to scan the different memory banks with it. But Mark's program is very good also.

Tom

712. Found another AGC problem

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-09-11 04:56:36 UTC
From: Radostin Danev
Topic: 712 Message: 712

Hi R75-ers,

Well, I got my Ph.D. and it is time for R75 again :-).

I recently observed what looked like filter "blow under". Using both 2.4 KHz filters in S-AM and USB/LSB modes I could see audio extending far beyond the cutoff of the IF filter in the audio spectrum.

(I use the shareware version of Analyzer2000 - very nice software!!! Get it here:
http://www.brownbear.de
It turns a PC with sound card into a very capable audio analysis tool.)

I first thought it was distortion somewhere in the audio chain. Using a cable with 100 nF series capacitor connected to the line input of the sound card I checked the audio chain from the volume control IC backwards. The problem was present even at the beginning of the audio chain. So it was not distortion in the audio chain.

The strange thing was that I observed the same effect in both S-AM/AM and USB/LSB modes. This meant that it is not a detector problem. It must be somewhere in the IF chain then.

Looking at the schematic I saw a strange thing. The AGC line is fed to the second gate of three IF chain FETs (Q471, Q721, Q891). To Q471 and Q721 it goes through RC filters with R=470kOhms and C=0.1uF (corner freq about 20Hz). But to Q891 it goes through R=2.2kOhms C=4.7nF (corner frequency about 100kHz!). Strange!
Checked with my audio probe and found that there is some audio passing through Q1063 (AGC amp) to the AGC line! So this audio is fed back to the IF chain through Q891. Why? I don't know ... but the design was clearly made with that in mind. If I switch off the AGC (Q1063 closed) and set the RF gain manually the distortion disappears.

I am currently working on a mod to fix this back-mixing of audio in the IF chain. There is an easy fix however (mentioned above) - turn off the AGC and use manual RF gain.

The distortion is observed in cases when the signal is above the AGC threshold (some indication on the S-meter). Most noticeable with narrow filters. When AGC is off and manual RF gain is used the audio level in the stopband (beyond the filter cutoff) drops with about 20-30dB. So when the AGC is on the filter looks like it has about -20 to -30 dB stopband attenuation (or sometimes may seem to blow under). With AGC off I see about -50 to -60 dB.

Tomorrow I will post some spectrum graph illustrating the effect.

In conclusion:
If you are hunting difficult DX or want the best of audio fidelity turn off the AGC and use manual RF gain.

Best regards,

Rado

Thank you Rado!

What happened this morning is so horribly unreal it is like being in
some kind of waking nightmare. I am on the West Coast, but this awful
tragedy has affected our entire nation as well as the rest of the world.
Although I didn't personally lose any family or friends in the incident,
I know those who have. It is horrible beyond belief.

All I can say is cherish your loved ones, be good to one another,
practice random acts of kindness and if you're in the US please donate
blood. Pray for us.

Thank you,
--

Subject: [icomr75] Found another AGC problem

Hi R75-ers,

Well, I got my Ph.D. and it is time for R75 again :-).

I recently observed what looked like filter "blow under". Using both 2.4 KHz filters in S-AM and USB/LSB modes I could see audio extending far beyond the cutoff of the IF filter in the audio spectrum.

(I use the shareware version of Analyzer2000 - very nice software!!! Get it here:
http://www.brownbear.de
It turns a PC with sound card into a very capable audio analysis tool.)

I first thought it was distortion somewhere in the audio chain. Using a cable with 100 nF series capacitor connected to the line input of the sound card I checked the audio chain from the volume control IC backwards. The problem was present even at the beginning of the audio chain. So it was not distortion in the audio chain.

The strange thing was that I observed the same effect in both S-AM/AM and USB/LSB modes. This meant that it is not a detector problem. It must be somewhere in the IF chain then.

Looking at the schematic I saw a strange thing. The AGC line is fed to the second gate of three IF chain FETs (Q471, Q721, Q891). To Q471 and Q721 it goes through RC filters with R=470kOhms and C=0.1uF (corner freq about

20Hz). But to Q891 it goes through R=2.2kOhms C=4.7nF (corner frequency about 100kHz!). Strange!
Checked with my audio probe and found that there is some audio passing through Q1063 (AGC amp) to the AGC line! So this audio is fed back to the IF chain through Q891. Why? I don't know ... but the design was clearly made with that in mind. If I switch off the AGC (Q1063 closed) and set the RF gain manually the distortion disappears.

I am currently working on a mod to fix this back-mixing of audio in the IF chain. There is an easy fix however (mentioned above) - turn off the AGC and use manual RF gain.

The distortion is observed in cases when the signal is above the AGC threshold (some indication on the S-meter). Most noticeable with narrow filters. When AGC is off and manual RF gain is used the audio level in the stopband (beyond the filter cutoff) drops with about 20-30dB. So when the AGC is on the filter looks like it has about -20 to -30 dB stopband attenuation (or sometimes may seem to blow under). With AGC off I see about -50 to -60 dB.

Tomorrow I will post some spectrum graph illustrating the effect.

In conclusion:
If you are hunting difficult DX or want the best of audio fidelity turn off the AGC and use manual RF gain.

Best regards,

Rado

Hi Johan,

I checked the schematics of many Icom radios - almost all of them share the same AGC implementation. They simply have one well established design and the changes from radio to radio are small or none in some parts.

Best regards,

Rado

Hi Rado,

They simply have one well established design and the changes from radio to radio are small or none in some parts.

Haven't been able to compare the various Icom schematics and as wondering if you were referring (above) to just the AGC or the whole radio? BTW, I love the R75!

Many thanks,

Bill Ashlock

To the AGC and some other parts. The designs are like composed of many modules - AGC, front-end filtering, mixers etc. So they take some modules from previous designs, some are newly designed and make a new radio. I would have liked if the engineers tried to design each new radio from a scratch - this way there will be new ideas and improvements. Surely this approach is more time and money consuming and involves higher risk of design flaws.

You can find schematics of many (mainly amateur transceivers) radios here:

http://www.krasnodar.online.ru/hamradio/sch_eng.html

Best regards,

Rado

From: tooele@jps.net
Topic: 725 Message: 725

Hi,

A few years ago I had a Kenwood R-5000 connected to an outdoors Datong active antenna and was not bothered by local AM broadcast stations appearing several places on the dial. Then for 2 or 3 years I had no SWL table radio. But now with a new Icom R-75 connected to the same Datong mounted in the same location, I find couple of local AM stations ghosting up and down the band up to about 3.5 mHz. Is the R-75 really that much more sensitive to AM broadcast interference then the Kenwood was? Or perhaps is it more likely that the Datong might not work as well as it did a few years ago?

726. squelch speed?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-09-18 06:55:00 UTC
From: jemmex@yahoo.com
Topic: 726 Message: 726

Probobly like a lot of swl/dxers this week i have spent a lot of time monitoring my fave Mil-Air freqs. One problem I have is the squelch opens and closes too fast in SSB. Seems not to be dependant on the AGC setting.

IF i set it to be just silent whenthere is no signal, then it seems to open for the slightest crackle -which is Ok- but to clip any vioce transmissions terribly. to the point of unusablity.

IS it possible to slow the squelch? Im not too fussed on opening speed. The fast opens are good, but i ould sacrifice the first word, if it could be delayed for half a second or so from going silent again. Just to "ride over" the quieter speech.
ANy ideas?

73 and peace to all

From: Radostin Danev
Topic: 726 Message: 727

Hi Jem,

If the squelch knob is in the "Noise squelch (FM mode)" zone (check the R75 manual) then it will not operate reliably in SSB. The "S-meter squelch" zone is derived directly from the S-meter level (AGC line) so it should be affected by the AGC speed. For weak SSB signals (say below S3) I expect the S-meter squelch will also not operate reliably (chop the speech).
There is no (simple) scanning solution for weak SSB signals other than leaving the squelch open and manually stooping the scan when you hear transmission (manual squelch :-)).

Best regards,

Rado

Hi Linda,

A way to check if it is the receiver is to switch on the attenuator. If the harmonic (or intermod) completely disappears then it is probably the radio. If you can still hear it (although very weak) then it is likely the antenna.

From memory: the level of 2nd harmonic is proportional to the square of the signal intensity. In decibels this means that the level of the second harmonic will increase (decrease) twice the amount of increase (decrease) of the original signal.

Are the spurii you observe second harmonics? (twice the freq. of the original signal)
How strong are the local stations on the S-meter? Above S9+60?

Check that the amplifier in the antenna module receives the proper DC supply voltage. If the supply voltage is below the spec it may distort. Check also all connectors for oxidation or corrosion. If you can open the amplifier module at the antenna check for corrosion on the PCB (due to water leakage or humidity).

The strongest local station I have is above S9+60 and I do not observe any 2nd level harmonic. R75 has good front-end preselection and I think your problem is more likely to be related to the active antenna.

Best regards,

Rado

Linda,

The receiver is seldom the problem when you have the ghosting effect (or intermodulation by strong local stations) with broadband active antennas. To eliminate the receiver as the problem, insert a 20db pad (attenuator) between the antenna output and the receiver and see if the ghosting is greatly reduced as a percentage of the normal signal level. It should not change if the receiver is OK.

Is it possible that you have gained an additional station in your area over the last two or three years that is giving the Datong a tougher environment? Also, has the power increased on any of the AM stations?

One trick I have discovered in the use of active antennas is to connect the antenna to an oscilloscope and use it as a simple spectrum analyzer. You can also connect a 3ft wire antenna to to a 10X scope probe to see the same local spectrum without even using the active antenna (do not touch while making mesurements). You should be able to see the offending signal/signals at a 0.1 volt/cm gain setting on the scope. In my back yard I can see one of the Boston area AM stations, even though 20 miles distant, at 0.6 v p-p. This level is a real problem for any active antenna amplifier.

Dave,

If I remember correctly, there's a little trick with some scopes (I used to use a solid state Tektronix model) that accept an externally triggered timebase. You can hook up an external generator in lieu of the timebase. What that waveform does is act like a VFO as the scope sweeps. That being said, I haven't been on a bench in almost 20 years, so the particulars are kind of hazy (read: I may have this all screwed up <G>) - but it can be done.

Hi Mark/Dave,

If you set up the scope time base for approximately 0.2 usec/cm in this area you will see a mishmage of sine waves with differing periods and amplitudes. With a little patience I can pick out most of the strong AM stations based on the period of their sine wave and make a rough estimation of the amplitude. For example 680kHz has a period of 1.5us and approximately 0.6 v p-p and 1030khz has a period of just under 1 usec with an amplitude of approximately 0.3 v p-p. You can even get a fairly good approximation of the signal strength in volts/meter by understanding that a capacity divider is formed by the spatial capacity of a one meter wire (approx 9 pf) and the input capacity of the 10X scope probe. If the probe also had a 9pf capacity, a 2 to 1 signal division would result. Therefore my 0.6 p-p signal measurement would compute to 2 x .6 /(2 x sq rt 2) or about 0.4 v/m. (the 2 x sq rt 2 is the conversion from p-p to RMS) Give it a try.

From: dxr75@aol.com
Topic: 735 Message: 735

Hello Group,
I am brand new to this group. I have an Icom IC-R75
shipped and on the way to my shack. I've read several
of the older posts on this newsgroup and I need a bit
of clarification on my filter alignment.

My R75 has the optional UT-106 AF DSP unit installed
and the two stock filters.
I have placed an order for the optional
FL-257 SSB Wide 3.3 KHz filter.
Here's my question.
Once I install the new 3.3 KHz filter, how will I need to
set my filter control settings to get the best benefit from the
3.3 KHz filter?
Is there anything that I should know about the installation of
the filter?
Thanks for your help.
Bart

Personally I don't and wouldn't use squelch for SSB. In fact most
people don't. It's too easy to miss weak signals, and will cause the
clipping that you describe. The R75 will scan with the squelch wide
open, so you will still be able to scan for SSB signals that way.

739. Power supply suggestion...

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-09-21 03:09:50 UTC
From: DanJBlack@prodigy.net
Topic: 739 Message: 739

I realize that many in this group may not have extensive facilities to support their R75, such as operating station/console, centralized grounding, tower-supported antenna arrays, coaxial switches, etc. But no matter how much "peripheral" accessory equipment you may have, one of the best means of ensuring smooth power and improved performance of your R75, is to use a "bench" power supply, which is usually rated between 10 and 35 amperes at 13.6 to 13.8 VDC, and which are REGULATED at that voltage.

The R75 "floor wart" or "brick" supplies that come with many R75's are UNregulated voltage sources. The unloaded (no receiver connected) output from this supply is significantly greater than the output under load. Regulated DC supplies are much more stable under load, and provide very low ripple values while at the same time maintaining a very steady DC voltage under many listening and operating conditions.

As an amateur radio operator, my own bench includes just such a supply, of sufficient amperage rating to facilitate all of my various receivers, transceivers and powered accessories. This supply is configured as a "bus", with an MFJ multi-terminal distribution unit serving as the central connecting point for all DC-powered devices. Adding, removing or changing a piece of equipment is greatly simplified in this way, and the result is "clean", hum-free DC power for all my gear.

The DC supply I use is an Astron brand 30-amp model, connected to the AC house mains via a computer-grade surge suppressor. I also have a solid bar bolted to the rear underside of my operating desk, about 32 inches in length. This serves as a grounding bus for all RF gear, and is connected by a thick conductor to an exterior ground at the base of my antenna tower.

Grounding a piece of equipment is made simple, using short braided copper straps between screw lugs on the bus and the cabinet ground of the equipment. I have room for fifteen grounding straps on this bus, and once again, changes or additions to the station are easily facilitated without disturbing the rest of the setup.

While your particular situation may vary greatly from mine, the use of even a 10-amp DC regulated supply is beneficial, and I highly recommend even higher current capacities, to accomodate future additions you may make to your operating/listening post. While I do not have an R75 anymore, I do plan to re-acquire one in the near future (my third !), as it still is the best value in a receiver currently available.

Just my "two cents' worth"...

BE A MILLIONAIRE LIKE OTHERS WITHIN A YEAR!!!

Before you say ''Bull'', please read the following. This is the letter you have been hearing about on the news lately. Due to the popularity of this letter on the Internet, a national weekly news program recently devoted an entire show to the investigation of this program described below, to see if it really can make people money. The show also investigated whether or not the program was legal.

Their findings proved once and for all that there are ''absolutely NO Laws prohibiting the participation in the program and if people can -follow the simple instructions, they are bound to make some mega bucks with only $25 out of pocket cost''. DUE TO THE RECENT INCREASE OF POPULARITY & RESPECT THIS PROGRAM HAS ATTAINED, IT IS CURRENTLY WORKING BETTER THAN EVER.

You are supplying information for a small fee- People will request from you copies of all reports many times over. This is a cash business better than a Mc ee D.!!!!!
Each report will give you the information you will need to succeed.

This is what one had to say: '' Thanks to this profitable opportunity. I was approached many times before but each time I passed on it. I am so glad I finally joined just to see what one could expect in return for the minimal effort and money required. To my astonishment, I received total $610,470.00 in 21 weeks, with money still coming in''. Pam Hedland, Fort Lee, New Jersey.

==========

Here is another testimonial: ''' this program has been around for a long time but I never believed in it. But one day when I received this again in the mail I decided to gamble my $25 on it. I followed the simple instructions and walaa ..... 3 weeks later the money started to come in. First month I only made $240.00 but the next 2 months after that I made a total of $290,000.00. So far, in the past 8 months by re-entering the program, I have made over $710,000.00 and I am playing it again. The key to success in this program is to follow the simple steps and NOT change anything.'' More testimonials later but first,

========== PRINT THIS NOW FOR YOUR FUTURE REFERENCE ==========

$$$

===
Within a few days you will receive, vie e-mail, each
of the 5 reports from these 5 different individuals.
Save them on your computer so they will be accessible
for you to send to the 1,000's of people who will
order them from you. Also make a floppy of these
reports and keep it on your desk in case something
happen to your computer.

===
IMPORTANT __ DO NOT alter the names of the people who
are listed next to each report, or their sequence on
the list, in any way other than what is instructed
below in step '' 1 through 6 '' or you will lose out
on majority of your profits. Once you understand the
way this works, you will also see how it does not work
if you change it. Remember, this method has been
tested, and if you alter, it will NOT work !!! People
have tried to put their friends/relatives names on all
five thinking they could get all the money. But it
does not work this way. Believe us, we all have tried
to be greedy and then nothing happened. So Do Not try
to change anything other than what is instructed.
Because if you do, it will not work for you. Remember,
honesty reaps the reward!!!

1.... After you have ordered all 5 reports, take this
advertisement and REMOVE the name & address of the
person in REPORT # 5. This person has made it through
the cycle and is no doubt counting their fortune.

2.... Move the name & address in REPORT # 4 down TO
REPORT # 5.

3.... Move the name & address in REPORT # 3 down TO
REPORT # 4.

4.... Move the name & address in REPORT # 2 down TO
REPORT # 3.

5.... Move the name & address in REPORT # 1 down TO
REPORT # 2

6.... Insert YOUR name & address in the REPORT # 1
Position.

PLEASE MAKE SURE you copy every name & address
ACCURATELY!
==

**** Take this entire letter, with the modified list
of names, and save it on your computer. DO NOT MAKE
ANY OTHER CHANGES.

Save this on a disk as well just in case if you lose any data. To assist you with marketing your business on the internet, the 5 reports you purchase will provide you with invaluable marketing information which includes how to send bulk e-mails legally, where to find thousands of free classified ads and much more. There are 2 Primary methods to get this venture going:

METHOD # 1: BY SENDING BULK E-MAIL LEGALLY

==========

Let's say that you decide to start small, just to see how it goes, and we will assume You and those involved send out only 5,000 e-mails each. Let's also assume that the mailing receive only a 0.2% response (the response could be much better but lets just say it is only 0.2%. Also many people will send out hundreds of thousands e-mails instead of only 5,000 each). Continuing with this example, you send out only 5,000 e-mails.

With a 0.2% response, that is only 10 orders for report # 1. Those 10 people responded by sending out 5,000 e-mail each for a total of 50,000. Out of those 50,000 e-mails only 0.2% responded with orders.

That's=100 people responded and ordered Report # 2.

Those 100 people mail out 5,000 e-mails each for a total of 500,000 e-mails.
The 0.2% response to that is 1000 orders for Report # 3.

Those 1000 people send out 5,000 e-mails each for a total of 5 million e-mails sent out.
The 0.2% response to that is 10,000 orders for Report #4.

Those 10,000 people send out 5,000 e-mails each for a total of 50,000,000 (50 million) e-mails.
The 0.2% response to that is 100,000 orders for Report # 5
THAT'S 100,000 ORDERS TIMES $5 EACH=$500,000.00 (half million).

Your total income in this example is: 1..... $50 + 2..... $500 + 3.....$5,000 + 4..... $50,000 + 5..... $500,000 ..... Grand Total=$555,550.00

NUMBERS DO NOT LIE. GET A PENCIL & PAPER AND FIGURE OUT THE WORST POSSIBLE RESPONSES AND NO MATTER HOW YOU CALCULATE IT, YOU WILL STILL MAKE A LOT OF MONEY !

==========
REMEMBER FRIEND, THIS IS ASSUMING ONLY 10 PEOPLE ORDERING OUT OF 5,000 YOU MAILED TO. Dare to think for a moment what would happen if everyone or half or even one 4th of those people mailed 100,000 e-mails each or more? There are over 150 million people on the Internet worldwide and counting. Believe me, many people will do just that, and more!

METHOD # 2 : BY PLACING FREE ADS ON THE INTERNET
==========
Advertising on the net is very very inexpensive and there are hundreds of FREE places to advertise. Placing a lot of free ads on the Internet will easily get a larger response. We strongly suggest you start with Method # 1 and add METHOD # 2 as you go along. For every $5 you receive, all you must do is e-mail them the Report they ordered. That's it. Always provide same day service on all orders.

This will guarantee that the e-mail they send out, with your name and address on it, will be prompt because they can not advertise until they receive the report.

========== AVAILABLE REPORTS==========

ORDER EACH REPORT BY ITS NUMBER & NAME ONLY. Notes: Always send $5 cash (U.S. CURRENCY) for each Report. Checks NOT accepted. Make sure the cash is concealed by wrapping it in at least 2 sheets of paper. On one of those sheets of paper, Write the NUMBER & the NAME of the Report you are ordering, YOUR E-MAIL ADDRESS and your name and postal address.

PLACE YOUR ORDER FOR THESE REPORTS NOW :
==========
REPORT # 1 : ''The Insider's Guide to Advertising for Free on the Net''
Order Report # 1 from:

Teresita Santos
1-7 Row House Rawis
Don Bosco, Tondo Manila
Philippines 1012

REPORT # 2 : ''The Insider's Guide to Sending Bulk e-mail on the Net''
Order Report # 2 from :

Bianca Elaine
c/o Joy Casanova
35 India St., Better Living Subd.
Paranaque City
Philippines 1711

the net''
Order Report # 3 from:

Kris H. Webber
Sankt Hansgade 24,3th.
Copenhagen 2200
Denmark

REPORT # 4 : ''How to become a millionaire utilizing
MLM & the Net''
Order Report # 4 from:

J Profit
P.O.Box 38333
Greensboro,NC 27438-8333
USA

REPORT # 5 : ''HOW TO SEND 1 MILLION E-MAILS FOR
FREE''
Order Report # 5 from:

Auralyn Joy
c/o Maximo L. Quijano
2262 Road 3
San Andres Bukid
Manila City
Philippines 1017

$$$$$$$$$ YOUR SUCCESS GUIDELINES $$$$$$$$$$$

Follow these guidelines to guarantee your success:

=== If you do not receive at least 10 orders for
Report #1 within 2 weeks, continue sending e-mails
until you do.

=== After you have received 10 orders, 2 to 3 weeks
after that you should receive 100 orders or more for
REPORT # 2. If you did not, continue advertising or
sending e-mails until you do.

=== Once you have received 100 or more orders for Report # 2, YOU CAN RELAX, because the system is already working for you, and the cash will continue to roll in ! THIS IS IMPORTANT TO REMEMBER: Every time your name is moved down on the list, you are placed in front of a different report.

You can KEEP TRACK of your PROGRESS by watching which report people are ordering from you. IF YOU WANT TO GENERATE MORE INCOME SEND ANOTHER BATCH OF E-MAILS AND START THE WHOLE PROCESS AGAIN. There is NO LIMIT to the income you can generate from this business !!!

==========

FOLLOWING IS A NOTE FROM THE ORIGINATOR OF THIS PROGRAM:
You have just received information that can give you financial freedom for the rest of your life, with NO RISK and JUST A LITTLE BIT OF EFFORT. You can make more money in the next few weeks and months than you have ever imagined.

Follow the program EXACTLY AS INSTRUCTED.
Do Not change it in anyway. It works exceedingly well as it is now. Remember to e-mail a copy of this exciting report after you have put your name and address in Report #1 and moved others to #2 .....# 5 as instructed above. One of the people you send this to may send out 100,000 or more e-mails and your name will be on every one of them. Remember though, the more you send out the more potential customers you will reach. So my friend, I have given you the ideas, information, materials and opportunity to become financially independent. IT IS UP TO YOU NOW!

========== MORE TESTIMONIALS==========

'' My name is Mitchell. My wife, Jody and I live in Chicago. I am an accountant with a major U.S. Corporation and I make pretty good money. When I received this program I grumbled to Jody about receiving ''junk mail''. I made fun of the whole thing, spouting my knowledge of the population and percentages involved. I ''knew'' it wouldn't work. Jody totally ignored my supposed intelligence and few days later she jumped in with both feet. I made merciless fun of her, and was ready to lay the old ''I told you so'' on her when the thing didn't work. Well, the laugh was on me! Within 3 weeks she had received 50 responses. Within the next 45 days she had received

total $ 147,200.00 ..... all cash! I was
shocked. I have joined Jody in her ''hobby''. Mitchell
Wolf M.D., Chicago, Illinois
==========
'' Not being the gambling type, it took me several
weeks to make up my mind to participate in this plan.
But conservative that I am, I decided that the initial
investment was so little that there was just no way
that I wouldn't get enough orders to at least get my
money back''. '' I was surprised when I found my
medium size post office box crammed with orders. I
made $319,210.00 in the first 12 weeks. The nice thing
about this deal is that it does not matter where
people live. There simply isn't a better investment
with a faster return and so big''. Dan Sondstrom,
Alberta, Canada
==========
'' I had received this program before. I deleted it,
but later I wondered if I should have given it a try.
Of course, I had no idea who to contact to get another
copy, so I had to wait until I was e-mailed again by
someone else.....11 months passed then it luckily
came again..... I did not delete this one! I made
more than $490,000 on my first try and all the money
came within 22 weeks''. Susan De Suza, New York, N.Y.
==========
'' It really is a great opportunity to make relatively
easy money with little cost to you. I followed the
simple instructions carefully and within 10 days the
money started to come in. My first month I made $
20,560.00 and by the end of third month my total cash
count was $ 362,840.00. Life is beautiful, Thanx to
internet''. Fred Dellaca, Westport, New Zealand

Are you using the software or pressing the scan button on the front of the radio? If you're using the scan button on the radio to scan memory channels, there will be a delay of about ten seconds with the squelch open. The only way I can think of to get around this is to use Icom's computer control software, which will allow you to select different delay times, or none at all. When you select 0, it will scan from one channel to the next without a delay. However, when you're in the VFO and you press the scan button, it will keep going until you press a button or turn the tuning knob. This will work whether the squelch is open or not. The software will also allow you to scan this way, with a selectable delay time.

Yes! I use it regularly and wouldn't be without it. I've managed to log tons more utility stations by using the software than I did without it.

Thanks for the reply, Tom. I am using the scan button on the radio. I do not have any control software. That brings to mind another question, however. My PC is in the next room from my radios. It is possible that I could run a serial cable from one room to the next. If I did that and installed the software, will I have to be at the computer to hear the radio, or can I sit at the radio and listen to it while using the scan features in the software to control it? That way someone else can use the computer while I am listening to the radio.

--- In icomr75@y..., "Dave" <rickets@s...> wrote:
> Can RS-75 import databases yet?

Yes, provided they're in the right format. The format is as follows:

"00","SEL","FREQ","MODE","ATT","PAMP","ANT","COMMENT"

The "00" is the channel number. So your entries will look like this:

"01","Y","11.175MHz","USB"," OFF","PA 1","ANT 1","GHFS primary
daytime"
"02","Y","8.992MHz","USB"," OFF","PA 1","ANT 1","GHFS primary
nighttime"
"03","Y","11.244MHz","USB"," OFF","PA 1","ANT 1","GHFS"

Save the file with a .csv extension to save it as a memory bank. If
you can import data this way, you're set. However, if you have to
manually type them in, you're better off entering the channels in
with the program itself than entering all the quotation marks.

Hi Joe,

About the filters. Imagine the shortwave band as a big river - 30MHz wide = 30 000 kHz. This river is composed of many small streams - the broadcast stations, ham radio transmissions, utility transmissions, digital signals etc. If one wants to hear only one of the thousands transmissions (streams) then a filter is needed. The filter cold be imagined as a slit passing only one narrow portion of the whole river - just a few kHz wide. If the filter (slit) is too wide it will pass several of the small streams (transmissions) so you'll have difficulty distinguishing them. If the filter (slit) is the right width it will pass just the stream (transmission) you are interested in and stop other neighboring streams. If the filter is too narrow it will pass only part of the stream you are trying to listen and this will make the audio muffled.
I suggest you first use the radio with the stock filters. Get an idea of what the different filter bandwidths do to transmissions in AM and SSB modes. Then you can decide what kind of optional filters you need. It will depend on what are your interests - broadcast stations or utility signals. With the dual passband tuning (PBT) on R75 you can create virtual filters with narrower bandwidth.

There is a nice collection of info for beginners at DXing.com. Start here:

http://www.dxing.com/swlintro.htm

Best regards,

Rado

When using the software, you can use either the software or the radio to tune, so you could be in either location and listen. The software can be running and you can still operate the radio with the front panel controls. If you do set up for remote operation I'd also suggest using either a speaker with a long enough cord, or using one of those low-power FM transmitters to bring audio to the computer location.

Tom

758. Did the audio, AGC and S-AM mods. Thanks Rado!

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-10-01 23:16:10 UTC
From: jgedde@bestweb.net
Topic: 758 Message: 758

Today I opened up the ole R75 and did both the AGG/Synch detector and S-Am/AM audio level mods (see photos in the photos section)

I'm pleased to report that the receiver's audio is greatly improved and the distortion that made listening an unpleasant experience is just about gone. Some of the things that really bugged me about the receiver's performance are gone!

The synchronous detector/AGC mod was very effective. As far the the AGC mod goes, I was unable to find a station that exhibited the distortion present in rapidly fluttering signals that made the audio readable to me only when tuning using the ECSS technique.

The synch mod was also very effective. I found quite a few stations where I could detect a HUGE change in the distortion level if I enabled S-AM during a deep fade. Of course, S-AM needed to be enabled right after the station was tuned to allow the detector to lock.

The only downsides to the s-am mod are that now the blinking S in S-AM no longer works to show that the detector isn't locked. But considering the loud whistle the receiver emits (see below) during lock-up, it's obvious when the detector is not locked. In addition, the detector sometimes takes as long as 5-6 seconds to lock (I used the 100uF and 200uF specified in the pdf instructions along with a 12.1k 1% resistor).

During the carrier lock, the receiver emits a loud whistle that decreses in pitch in steps until the detector locks. Considering that the stock sync detector's performance was so pitiful, the whistle is music to my ears! Too bad my wife doesn't feel the same way!

I also performed the level mods. This was a bit tricky since the 4052 analog switch used for audio source switching is a small surface mount chip (TSOP?, TSSOP? pkg) and soldering 20k resistors to pin 11 and pin 15 was a royal PITA. I used 1/16W resistors, so it wasn't as bad as it could have been if I used Radio Shack fare 1/4 or 1/2W parts.

As far as the effectiveness of this mod, I cannot comment. I performed the mod in our lab at work and was unable to receive anything but garbage inside the building. Hence, before and after tests aren't meaningful.

However, given that ICOM seems to have given AM and S-AM less than the utmost attention relative to SSB/CW performance, normalizing the

AM/S-AM audio level to that of SSB must be a good thing. Now, LSB, USB, S-AM and AM all come through with equal volume.

Now, I just have to finnagle with the IF filters to make for a useful narrow AM setting. In my opinion, the 2.4 kHz setting is just too narrow and audio is VERY bad. I usually use the ECSS technique to pull signals out of adjacent signal interference rather than use the narrow AM filter.

I'm toying with the idea of putting the 6 kHz filter is place of the 15 kHz filter to allow S-AM to be tuned with better selectivity and purchasing the 3.3 kHz FL-257 filter for a medium selectivity mode.

Either that or see what Kiwa or Murata has to offer. Any recommendations? Since I don't use the FM mode, reducing the 15 kHz filter is an option as well.

What is the hot setup as far as SW broadcast listening as a primary function with still good ECSS/SSB performance?

I uploaded photos of the mods inside the receiver in the .../files/photos section.

Thanks again Rado...

John Gedde

Hi John,

I'm glad you like the mods.
Soon there will be more mods/improved mods coming. Here is a list:

1) Hang-type AGC with continuously adjustable hang time (from 0s - stock AGC to 3-4s). I've finalized the schematic (this one requires several additional components). Works VERY well in both AM/S-AM and SSB/CW. Also fixes the audio mix-back in the IF chain through the AGC line .

2) Improved S-AM mod. Automatic switching to AM when the synch detector is not locked (the blinking S- is back). This one also requires few transistors. No whistles or very short ones (like 0.1-0.2s beeps) when tuning around in S-AM mode. Still working on the final version.

3) Audio chain dynamic range improvement (was AM/S-AM audio level mod). This one fixes a problem in the audio chain where the output of the pre-amp in the electronic volume IC is driven at its spec limit (0.6Vrms). This in many cases may produce clipping (spikes) in the audio. Also limits the range of useful RF gain when the AGC is off (one cannot open the receiver much more than the auto AGC level because distortion starts in the audio chain).

4) Tone control. I'll add a tone controls (bass & treble) to my R75 in an external box - together with the hang-AGC hang time control. I'm really missing such controls. Sure - one can connect the line out to external amp/equalizer/tone controls. But I want it to be part of the receiver.

I'll publish all the mods in a new version of "The R75 mod book". Maybe after a month.

Also thinking of making it like "The R75 book" with mods, tips, tricks etc. (experience, tips, advice, FAQs extracted from the archives of this group). But this will be a long time project.

Best regards,

Rado

If your wife is very annoyed with the whistles here is a trick. Turn on the ANF (auto notch filter, if you have the UT-106 DSP) when tuning around in S-AM mode. This kills the whistles. When you are settled on a station and the synch is locked turn off the ANF.

Best regards,

Rado

Hi once again John,

Some additional comments:

> Now, I just have to finnagle with the IF filters to make for a useful
> narrow AM setting. In my opinion, the 2.4 kHz setting is just too
> narrow and audio is VERY bad. I usually use the ECSS technique to
> pull signals out of adjacent signal interference rather than use the
> narrow AM filter.

Try this for S-AM mode. Set 2.4kHz/IF9MHz and 6kHz/IF450kHz filters for the narrow setting. Now tune to a station and use the 9MHz PBT (outer knob) to select upper or lower sideband. Compare this to the same filter setting in AM mode.

> I'm toying with the idea of putting the 6 kHz filter is place of the
> 15 kHz filter to allow S-AM to be tuned with better selectivity and
> purchasing the 3.3 kHz FL-257 filter for a medium selectivity mode.

There is a sense of putting the 6kHz filter in the place of the 15kHz one only if you have replacement 450kHz filter to put in place of the 6kHz filter. This is the Kiwa mod - they put a 3.8kHz filter in the place of the 6kHz one. I've done this in a less painful way - just replaced the 15kHz filter with 4kHz. Now this is the filter I use most for S-AM. Any optional filter (like FL-257) cannot be used for S-AM mode because they are all at 455kHz IF. Icom uses two 3-rd IFs 450kHz (15kHz & 6kHz stock filters) and 455kHz for the 2.4kHz stock filter and the optional filter. Don't ask why - this is the way things are :-) (no reasonable explanation).
Maybe you know all this ...

> Either that or see what Kiwa or Murata has to offer. Any
> recommendations? Since I don't use the FM mode, reducing the 15 kHz
> filter is an option as well.

I've put Murata CFWS450IT (4kHz) in the place of the 15kHz filter. Works very well!

> What is the hot setup as far as SW broadcast listening as a primary
> function with still good ECSS/SSB performance?

I have the optional FL-257 but I rarely use it (I rarely use AM mode). For SSB/ECSS it's little bit wide for my taste. If you can replace the 15kHz filter with 4kHz your setup will be complete (at least it is for me). Still I'm thinking of the 2.8kHz/IF9MHz (FL-103) filter - it may be a good choice.

I'm sorry for the multiple replies. Things got coming into my mind gradually.

Best regards,

Rado

Rado,

Thanks again! Especially for taking the time to make those multiple replies.

>Try this for S-AM mode. Set 2.4kHz/IF9MHz and 6kHz/IF450kHz filters
>for the narrow setting. Now tune to a station and use the 9MHz PBT
>(outer knob) to select upper or lower sideband. Compare this to the
>same filter setting in AM mode.

This idea worked well. I'm not sure I fully understand why it works only on S-AM though...

>There is a sense of putting the 6kHz filter in the place of the
>15kHz one only if you have replacement 450kHz filter to put in place
>of the 6kHz filter. This is the Kiwa mod - they put a 3.8kHz filter
>in the place of the 6kHz one. I've done this in a less painful way -
>just replaced the 15kHz filter with 4kHz. Now this is the filter I
>use most for S-AM. Any optional filter (like FL-257) cannot be used
>for S-AM mode because they are all at 455kHz IF. Icom uses two 3-rd
>IFs 450kHz (15kHz & 6kHz stock filters) and 455kHz for the 2.4kHz
>stock filter and the optional filter. Don't ask why - this is the
way >things are :-) (no reasonable explanation).
>Maybe you know all this ...
>I've put Murata CFWS450IT (4kHz) in the place of the 15kHz filter.
>Works very well!

Does the Murata unit install directly in place of the 15 kHz or 6 kHz units? In other words, are they mechanically similar enough that they will just drop in the existing through holes in the PCB?

Where did you get your Murata unit from? I have checked my usual electronics distributors and they don't stock the 450 kHz line.

By the way: I was looking at the alignment procedure pdf. What does the filter calibration do? Will I need to perform this after swapping filters around and/or installing the 4 kHz Murata filter?

>2) Improved S-AM mod. Automatic switching to AM when the synch
>detector is not locked (the blinking S- is back). This one also
>requires few transistors. No whistles or very short ones (like 0.1-
>0.2s beeps) when tuning around in S-AM mode. Still working on the
>final version.

I can't wait to check it out! I like the idea of having the unit automatically switch into envelope detector mode when the synch detector is unable to lock.

>I'll publish all the mods in a new version of "The R75 mod book".
>Maybe after a month.

What is the "R75 mod book?" I've never heard of it....

Best regards,
John

But it appears from opening the RS-R75 memory bank (.csv) files in a text editor that each entry has to have quotation marks around it as well as being in comma delimited form. I haven't tried to see if it will work without the quotes or not.

OK, I wasn't sure if the quotation marks would make any difference or not. I just tested it, and they don't. So you can enter your memory banks in a spreadsheet or database, save it as a comma delimited file, and open it with the RS-R75 program. Alternatively, you could enter the data in a text editor, using commas between each entry, and save it as a .csv file. Using a spreadsheet/database would be easier than entering the memories in using the RS-R75 program. Just be sure not to enter more than 100 memory channels.

Hi John,

> Thanks again! Especially for taking the time to make those multiple
> replies.

You are welcome!

> This idea worked well. I'm not sure I fully understand why it works
> only on S-AM though...

It should work to some extent in AM also, but if the station is fading there will be strong distortion heard.

> Does the Murata unit install directly in place of the 15 kHz or 6 kHz
> units? In other words, are they mechanically similar enough that
> they will just drop in the existing through holes in the PCB?

Yes, the filters are from the same series. Same package, input/output impedance.

> Where did you get your Murata unit from? I have checked my usual
> electronics distributors and they don't stock the 450 kHz line.

I also had trouble finding the filter through distributors. I just wrote to Murata asking them for 1 or 2 samples of the filter to try in my "electronics project". They sent me two filters plus a bunch of catalogs and a CD. The second filter went to somebody in this group who was willing to perform the filter exchange.

> By the way: I was looking at the alignment procedure pdf. What does
> the filter calibration do? Will I need to perform this after
> swapping filters around and/or installing the 4 kHz Murata filter?

I don't know what exactly the procedure does. The filter works perfectly after installation without the execution of the procedure.

> What is the "R75 mod book?" I've never heard of it....

It does not exist yet. It will be a PDF file with collection of mods.

Best regards,

Rado

768. External Speaker

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-10-05 01:09:47 UTC
From: Bob
Topic: 768 Message: 768

If you are looking for an external speaker to clean up the 'tinny' sound of the internal speaker, head on down to your nearest Radio Shack store now! They have a RCA bookshelf speaker on sale for half-price - just $19.95 - until October 27. Their stock number is 40-5000. This is a shielded 2-way speaker with a 3" woofer and a dome tweeter. It sits 6.5 inches high. The black color looks very sharp next to the R-75. I picked one up about three weeks ago and am very happy with it. Makes listening to AM and even SSB much more pleasant. By the way, I am not an employee of RS nor am I a stockholder! I just think this is a great buy and wanted to share this with the group. Good listening.

I second this. I bought this same speaker (on sale)
for my R75, and it makes a world of difference. It is
far nicer sounding and more comfortable to the ear
than the built-in speaker.

They also have a shielded 4" midrange in a cubicle
cabinet for about $14.95; don't know how it would
perform though. The handsome little $19.95 speaker,
with its blackened aluminum case and nice grill on the
front, just looked nicer :-)

There's a rule, who's name escapes me that states a ratio between the lowest and highest frequency for a reproducer. Like: if your upper limit is 3500 Hz your low end shouldn't go below 350. 5 kHz: 50 Hz. This is supposed to assure the highest possible intelligibility. I just use the R-75 for voice. My all-time fave for voice was the Mocom 70 4".

Yeah - the little speaker I have is a full range speaker, with lows down to about 100 Hz and highs well above 12,000 Hz. The nice thing about the R75 is that the dual passband sort of helps to achieve a comfortable range as you describe even if you don't have the adjacent interference to mess with. Again, the Kiwa mods will help to more effectively use these controls on both AM and S-AM.

Hi, Bob,

I use the Grove SP-200B sound enhancer. It's a oak cabinet speaker with many functions.

The SP-200B combines an audio amplifier and 4 inch speaker along with separate bass/treble equalizers, a variable passband notch/peak filter, an adjustable noise limiter to reduce irritating pulse interference.

The price is about US$200, but it is not too expensive.

And now, Grove has released new SP-200C.

The site is;

776. PC Speakers for external speakers - Yes!

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-10-13 12:45:08 UTC
From: jgedde@bestweb.net
Topic: 776 Message: 776

The other day I had an idea spurred by the list discussion of external speakers.

I have a set of Harmon-Kardon PC speakers that came with my Dell computer. I upgraded the computer's speakers, and had the Harmons lying around.

I bought a 1/8" mono/stereo adapter from Radio Shack and used it to plug the Harmons into the Icom.

Great results! Since the Harmons are amplified and have their own separate Bass and Treble controls, audio quality is excellent and I can tweak the bass and treble controls to make anything from weak DX to strong signals sound better. Especially since there are two of them. Despite being mono, two speakers seem to give more depth of field.

Formally I was using a Radio Shack Optimus shielded center channel speaker. It was pretty good, but I'm much happier with the Harmons.

I have also tried the small Optimus bookshelf speakers, but I found that the high frequency response, due to having a tweeter, made noisy signals sound worse.

I still use the volume control on the Icom by setting the Harmon's volume control around mid scale...

Most likely it would not. To test: Ground your antenna input and listen you your radio while turning the noise generating appliance on and off. If you don't hear a difference then the noise is not coming from the power supply. You may need to locate an antenna away from the noise source and feed your radio with coaxial cable.

> to 12vdc power supply reduce or eliminate power line
> noise from such sources as appliance motors, lamp
> dimmers, etc?

R75 regulates the DC input down to 14V (internally it uses 14V in many parts ... for example the 1st mixer). Feeding it with something less than 14V will probably degrade slightly the characteristics (but maybe not significantly). Have you tried adding the bypass capacitors to the floor-wart? (see in the Files section "R75 mods" folder for info) URL: http://groups.yahoo.com/group/icomr75/files/R75%20mods/Floor-wart%20improvements.txt

Also try wrapping the DC cable 5-10 turns around a large ferrite "doughnut" as close as possible to the radio. If your radio is not grounded then some common mode noise can pass trough the floor wart. You can also try a ferrite on the antenna cable (if it is coax). What kind of antenna are you using?

Best regards,

Rado

779. Re: [icomr75] Power Supply

From: Bob
Topic: 775 Message: 779

Thanks, Rado. Hmm...I didn't realize the floor wart
was putting out 14v. Good point. I will try your
suggestions and also try to pinpoint the point of
entry of the interference, antenna vs. power line. My
radio is grounded through a 14awg wire to the cold
water pipe coming into the house (street side of the
water meter.) The interference is not constant - just
happens periodically as if someone just turned on a
vacuum cleaner or electric drill (not necessarily in
my house.) My antenna is a wire in the attic fed to
the radio through a wire, not coax. I have been
thinking of changing the feedline to coax, though.

You'll need a transformer to properly match the wire to the co-ax. Here's how to build one:

http://www.kc7nod.20m.com/new_page_1.htm

You can get the toroid (or a pre-assembled waterproof "MLB" transformer) from these fine folks:

http://www.palomar-engineers.com/MLB-1/mlb-1.html

Thanks, Rado. Hmm...I didn't realize the floor wart
was putting out 14v. Good point. I will try your
suggestions and also try to pinpoint the point of
entry of the interference, antenna vs. power line. My
radio is grounded through a 14awg wire to the cold
water pipe coming into the house (street side of the
water meter.) The interference is not constant - just
happens periodically as if someone just turned on a
vacuum cleaner or electric drill (not necessarily in
my house.) My antenna is a wire in the attic fed to
the radio through a wire, not coax. I have been
thinking of changing the feedline to coax, though.

Hello from a new R75 owner!

I'm having one heck of a time understanding how the filters work, how to customize them, and exactly how the TWIN PBT controls work. I found and read the messages in the archive, tried to understand the posted spreadsheet, but I'm lost. :(

On the brighter side I've received more distant stations in the last couple weeks than I have in the last couple years... :(

As I understand it, one filter shifts the second i.f., the other shifts the final i.f.

You can shift one high, the other low and get a very narrow passband. You can shift them both in one direction and get better out-of-passband rejection.

785. R75 DC Supply Voltage

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-10-19 03:10:54 UTC
From: Ian Johnson
Topic: 785 Message: 785

I knew I had it somewhere......

There was some discussion about the R75's power supply putting out 14V
and concern that less would not be enough.

Icom's specification is 11.7V to 15.9V at up to 1.1A.

So, 14V is a nominal voltage and the set can take down to 11.7V before
it's regulators can't put out required internal voltages.

A bit late. Hope it helps.

I've run this receiver off a wall-wart putting out 12V, 1000mA that I purchased while overseas.
No problems.
I don't understand the angst this thread has generated.

787. Re: [icomr75] R75 DC Supply Voltage

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-10-19 04:30:17 UTC
From: Radostin Danev
Topic: 785 Message: 787

Hi Ian & Don,

The floor-wart puts about 19V. 14V is one of the regulated internal voltages (down-regulated from the 19V of the floor-wart, check the shematic - IC1371(PQ30RV31), MAIN UNIT(2) down left). If the receiver is fed with less than 14V (e.g. 12V) the 14V internal line will follow the supply voltage (e.g. 12V). The set will still work, but there could be deterioration of some characteristics as dynamic range and IMD performance as the 1st mixer and Preamp1 use the 14V line. The decrease in performance will probably be small and unnoticeable. If you are feeding the receiver with not well filtered supply under 14V then the ripple will pass through the 14V regulator (as it will be wide open) and go to the 1st mixer and Preamp1. Use a high quality PS (well filtered) or battery.

Best regards,

Rado

Do you use this software? If so, I would like to ask
you a few questions as I am thinking of purchasing it.
Unfortunately, ICOM doesn't really give much of a
description of its features on their website.

What features do you find most useful?
Does the software add capabilities that the R-75
doesn't have on its own?
Does it allow you to set up multiple memory banks and
download them to the radio at will?
Please rate its ease of use (and learning.)
Is it a good value for the money (Universal sells it
for $60 plus shipping.)

Thanks for your input. If I have missed anything, feel
free to add to the list.

791. R75 Vs R8500

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-10-22 12:11:34 UTC
From: r7y528@home.com
Topic: 791 Message: 791

I like everything I've read here, but I'd like to know how the R75 rates vs the R8500 on hf only. Some of what I've read implies the R8500 is not so good for hf.

Also, I've seen mention of Rado's R75 Book, where can I find this?
Thanks

James

> R8500 is not so good for hf.

The R8500 is lacking some of the features of the R75, e.g. no preamp (if it is really needed you can use an external one), no *twin* PBT (there is a single passband "shift" for the SSB and CW filter), there's no sync detector, no DSP--noise reduction, notch filter, etc., & filter options are limited. Also, you cannot turn the AGC off on the R8500 (though there is a mod somewhere to defeat this). Nonetheless, the R8500 works fine on HF. You can use the SSB filter for AM narrow mode (you need to then detune by 1KHz). It also has an audio peak filter for adjusting the tonal quality. AM signals can be tuned in SSB mode (with no loss of volume) to combat selective fading. Further, the R8500 does an excellent job with SSB signals (and CW) as does the R75. And for the first hour from turning on the radio, the R8500 is a little more stable than the R75 (assuming the stock oscillator has not been upgraded). However, the R75 can tune in 1 Hz increments, however, the minimum increment on the R8500 is 10 Hz -- this is not that big of a deal (if the minimum were 100 Hz then we'd have a problem).

From: Ron Stephens
Topic: 791 Message: 793

I'm used to using an AR8000 scanner, so this shortwave stuff is new to me.

I'm trying to pick up foreign new sources exclusively. As a result, I'd like the R75 to sound as nice as possible.

My current setup:
DX-SWL-S antenna into 50 ohm coax to R75.

MY QUESTION:
I notice that Mr. Rado has several mods in the files section. How does this compare to the mods that KIWA make? Are the KIWA mods the same ones that Mr. Rado suggested, or are they derived from the work of Mr. Rado? I'd like to end up with the best solution for AM/S-AM. BTW, how about that KIWA audio mod?

Thanks in advance for any of your opinions!

Rado (bless him) did the initial research and development of the AM sync/AGC mod. This information was provided to Kiwa. I have the Kiwa mod and it looks similar to the Rado mod (by observing where the wires are soldered) but if I recall I do not remember the leg of the IC being lifted up from the board like in Rado's mod. Also, I cannot tell exactly which components and their values that Kiwa used, since they are sealed inside a plastic shell.

> I'd like to end up with the best solution
> for AM/S-AM. BTW, how about that KIWA audio mod?

Audio mod -- Kiwa replaces the capicitors that have an affect on audio with superior ones. I cannot discern specifically what effect this has on the audio, since I cannot isolate it from the effects of the AM sync/AGC mod. Nonetheless, with both mods, the radio does produce much improved sound. And the AM sync is improved -- the plain AM mode also seems improved with respect to fading signals (perhaps the plain AM mode on the R75 is a quasi-synchronous mode? Rado?).

Topic: 797 Message: 797

Hi all,

it's my first message in this discussion group but I read your good suggestions and opinions since some weeks ago (just before I bought my IC-R75).
I was very impressed by Rado's mods description and this evening decided to try them (not the Audio one) on my shining new receiver. I've just finished to do them (it's 3:41am here in Italy (!)) and they seem to work fine. My soldering experience and Rado's advice helped me a lot and I think I have done a nice work (sorry I do not have a camera here). For the moment I wish to thank Rado, I will post my impression about the mods in next posts.

> the radio sound better? It seems like it would reduce the fidelity!
> -ron

To install the 3.8KHz (450 KHz IF), Kiwa removes the 15KHz (450 KHz IF) from the radio, but just *moves* the 6KHz (450 KHz IF) filter from it's orignal position to where the 15KHz was installed. The 6KHz filter provides enough fidelity for AM (however it may be a problem for *some* but not all FM signals). The 3.8KHz filter (which does reduce fidelity) would only be used for AM *narrow* mode, which you only select to improve the rejection of adjacent channel interference.

The sync detector (after the Kiwa mod) whistles when gaining lock and
whistles when it loses lock. It appears to stay locked on most
signals. While testing it on a *very weak* station, it kept
whistling/howling (before the mod, it seemed to make no attempt to
gain lock).

When I had checked Kiwa's work, I noted that wires were soldered to
pins 3 and 23 in addition to pin 4 (AGC) of the IC.

Date: 2001-10-30 05:12:57 UTC
From: maritimus49@yahoo.com
Topic: 797 Message: 800

Hello everyone -
I just bought a mint R75 from ebay that is two months old. I am assuming from the various posts here that Icom never did any mods for the R75 after the various criticisms. I have been in touch with Kiwa about the audio, sync and filter mods. However, I have also seen references to Rado's mods and I'm wondering whether I should attempt them instead of paying Kiwa $80 plus postage for the audio and sync mods. Can you tell me where the original message from him is that describes these mods? I am assuming that a small (25 watts or less soldering iron (pencil) is necessary? Any comments will be appreciated. I am looking forward to getting the R75 in the mail. It seems to be an excellent choice. By the way, I appreciate the comment about PC speakers. I also like full audio and I have the use of two Labtec self-powered speakers with treble and bass controls. I will get the 1/8" mono to stereo adapter and use them.
Lastly, I was very pleased to see such a group of fellow R75 owners. What a resource!

73,
Bruce K6RQR

From: r7y528@home.com
Topic: 803 Message: 803

Next week, Monday -Tuesday around 2pm PST I'm going to be
checking out an Icom R75 and R8500, connected to the same
antenna (with a spllitter) in a side by side test of tuning.
Are there any frequencies that are fairly active or constant
(maybe a beacon) that I should try tuning in to compare
reception?
I'd ideally like to find a frequency with two stations very close
together so I can try the passband tuning on both rigs.

James Z.

ps I got 11.175 this afternoon on the R75 and heard some
interesting transmissions. The Twin Passband tuning improved
reception.

This could be a "heritage" from the naming of earlier Icom models.
The IC-R71 was produced in at least three flavours; -A for US, -D for Germany and -E for rest of Europe(/world?).
All variants had different limitations in frequency coverage.
I'm not aware of any variants of the R75. Frequency coverage seems to be the same for all markets.

>El mod. de Rado es muy bueno, aumenta mucho la funcion S-AM.

I'm very disappointed about this. After some days of test I haven't still found an AM modulated signal where I can hear the difference between AM and S-AM (modified, Rado's 1.1).
My IC-R75 seems to behave as expected after the mods, can hear the whines during tuning and a S-AM with a variable lock time from 1 to 5 or 6 seconds (sometimes, very rarely, it doesn't lock at all), the S indication does not blink anymore, *but* my receiver seems to never loose lock even removing the 12k resistor between pin 3 and 23 after having locked. Perhaps this is a simptom of a problem.

Any idea? Rado?

I'm sorry to hear this. Check once again the pin numbers and the wires.
To hear the difference you need to find a station with selective fading
distortion (when the signal fades the audio is distorted).

The whistles mean that you lifted pin 23 successfully. If the whistles
bother you - remove the resistor between pin 3 and pin 23. This will not
remove them completely but will shorten them significantly.

Sometime this week I will post an updated version of the S-AM mod. It
revives the blinking S-AM and further shortens the whistles but requires
more additional components (transistors). If you are interested wait until I
post the latest version.

Best regards,

Rado

Does this mean, in fact, there is a new "A" model?
And if no difference, why a new designation?

Ok, I see it. Missed that...Tnx!
But still, I don't believe there exists any "improved" A-model. In the case letters are used by suppliers or users, the purpose could be to reflect limitations in fq-coverage (a la R71) or mains voltage on the AC/DC-adapter.

I have already done the S-AM mod, and it works as advertised. The improvment in distortion in selective fading signals is most noticable with narrower bandwidths. Try it in narrow AM mode with both PBT controls turned all the way to the left or right to open up the IF a bit.

I can't wait to get ahold of Rado's new S-AM mods....

815. R75 mk11

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-03 01:15:45 UTC
From: Jem Cullen
Topic: 815 Message: 815

OK so the "A" stands for USA vers or similar.
Anyway lately icom seem to be using "Mk11" designation.
Heres a question. If/when Icom do update the r75, what functions/features performance changes would you like to see?

Given it must be vbasically the same radio, with no additional buttons or any thing that makes it lots more exopeensive just little things.

Obviously Rado sync/agc mod should be standard.
What else? Perhaps a 4khz filter? I would like a A-B vfo setup for checking //frequs or two sides of a duplex signal.

ALso I fingd the V/M button annoying. seems to be too easy to replace the VFO with tmemory freq when flicking back and forth, so a slight change there.cant have a tone, coz that would need extra knob,so is beyond our mental exercise here.

i owuld like the on/off timer to remember a frequency as well as time so it can be a better alarm clock - or to record particular transmissions.

ANY IDEAS?

Hi,

>I'm sorry to hear this. Check once again the pin numbers and the wires.
>To hear the difference you need to find a station with selective fading
>distortion (when the signal fades the audio is distorted).

It works! The mods were done correctly (after all I have some experience in electronics and the right equipment, even if I usually build up digital machines, and I checked the job "ad nauseam"), simply before now I haven't found the right signal. Some minutes ago I tuned the usual nocturnal trasmission of RAI (italian national broadcasting service) from Rome; this evening the signal is low (very strange, usually it is strong) and fades (not very deep) distort the audio; with S-AM the audio is clear and the difference is perceptible.

>Sometime this week I will post an updated version of the S-AM mod. It
>revives the blinking S-AM and further shortens the whistles but requires
>more additional components (transistors). If you are interested wait until
>I post the latest version.

Of course I'm curious and I will try the mod if it does not involve the use of external control boxes or modifications to the chassis (I do like to have all *inside* the radio and after all it is still new).

Yes, more memories, 200, 500? expanded frequency coverage.
always on clock. Built in RTTY display, Frequency spectrum...
woah, there goes the price.
How about a new model that does everyhting the Yaesu VR5000
does, but does it correctly, and has the features of the current
r75?

Whops! :) I thought that CI-V and direct serial protocol were different.
I've just connected my home made CI-V interface, after reading of your
message, and have seen that commands look identical. That is obvious... :)

How is the Icom R-75 for medium wave or broadcast, BCB, DXing? I'm very interested in this radio, and want to use it solely for this purpose. I see a modification which restores the MW band sensitivity, but how does the radio perform on this band without doing this mod? Does the radio have good enough selectivity, and does it perform well using ECSS?

Thanks for any help you can provide me.

> does it perform well
> using ECSS?

I live in the SF Bay area, where MW stations are
rampant and powerful. The radio certainly seems
sensitive enough as is, at least above 1 Mhz, although
if you live in a more remote location, additional
sensitivity wouldn't hurt.

If I were to do MW DXing here in station free-for-all,
I would not do the mod, at least at first. I'd get a
3.3 - 4 kHz filter for narrow AM reception, and the
1.9 kHz filter for SSB. I may do this anyway ;-)
After that, I'd then reassess the need for greater
sensitivity. The R75 has some pretty good preamps
anyway, and the ECSS performance is superb, especially
wiht the DSP and TPBT. Use headphones or an external
speaker for best results.

73,
Bruce Jensen

825. Have just done Rado's Mods 2.0

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-05 22:58:03 UTC
From: Simone Meggiato
Topic: 825 Message: 825

Hi all,

I have just finished to solder all what is needed to implement Rado's mod 2.0.
It seems to work fine, as expected. Whistles are very short; if S-AM doesn't lock AM is used and the S blinks.

In place of Q1 and Q2 I used two BC547B (high beta, common general purpose transistors).

Thank you Rado, this seems to be a nice job.

PS.
Rado, check the "description" section in your .pdf; I think there is mistake when you explain how the transistors work (at least there is a mistake if we mean the same when we say that a transistor "opens" or "closes").

I strongly agree with Bruce's comments. I have not modified the sensitivity in my R75 and it never has a problem digging out a weak signal. I have a Kenwood R5000 with the MW sensitivity increase mod and I would rate both radios as equal. Using a 300 foot longwire antenna and R75 preamp2 on, I get a local station (about 5 miles away) coming in on frequencies other than its correct one. I switch the preamp off and the problem goes away. Jim Springfield Ma.

I am glad to hear that.

> In place of Q1 and Q2 I used two BC547B (high beta, common general purpose transistors).

OK. I will add the info that BC547B is suitable.

> Thank you Rado, this seems to be a nice job.

You are welcome. :-)

> PS.
> Rado, check the "description" section in your .pdf; I think there is mistake when you explain how the transistors work > (at least there is a mistake if we mean the same when we say that a transistor "opens" or "closes").

Oh. I am working a lot with vacuum systems (electron microscope) and maybe I think of a transistor as a valve. When it is "open" it passes current through. You seem to think of it as a switch - when it is "closed" it passes current. I will think of some other terms - thank you for noting.

Best regards,

Rado

Hi,
I also live in the SF Bay area (hi, Bruce!--Palo Alto area), and use my R75 with no mods for LF beacon DXing, with an active whip antenna. I use Preamp 1 turned on, and find with that configuration I have completely adequate sensitivity. Of course I have to use an LF low pass filter between antenna and receiver to prevent overloading the receiver with the many strong BCB stations.
Incidentally, Preamp 2 was primarily designed to be used above 30MHz; it's an integrated circuit, and has very poor overload resistance (intercept points).
I use an aftermarket 250Hz CW filter for all my LF listening (actually I have one in both the 9MHz and 455kHz positions).
The noise blanker in the R75 is especially effective; rivalling that of the Drake R8B and, oddly, the lowly Yaesu FRG-7700.
Even being some 40 miles or so from the ocean, off-shore LF beacons from places like Alaska, Easter Island, Japan, etc. are regularly heard here. Unfortunately, urban noise buzzes frequently prevent any LF reception, that even the noise blanker won't reduce sufficiently.
Steve

I have the same problem.....I work with Hydraulic Systems on aircraft and
coming
from an electronic background I always get the two terms(OPEN-fluid flowing
/CLOSED fluid stopped). Where as in a relay when things are open there is no
action or current flow. Totally opposite .I could not figure out why I kept
getting
these two operations reversed until I thought about relays and their two
states of
operation.

This whole valve terminology when used in conjunction with transistors seems
to be
a passover form the days of tubes. Also, seems more prevalent in countries
other than
the US. Nothing is wrong with it....it's just different.

I have a second R75 here(enjoyed the first so much I had to buy another) and
have
not done any mods to it. I look forward to trying out the new Rado Mod.on
it.

Currently my job is in jeopardy(due to the recent acts of terrorism and the
economic
effects it has had on the airline industry) and I will most likely be on the
job search
here shortly. So, I will have plenty of time to work this mod. between job
interviews.
Sounds like a pleasant diversion!

No kidding! - my LW is full of BCB (strangely, much more than I have on my double conversion FRG-100 - how come?).

Interesting - is this publicly stated? I use it on HF all the time...

<snips>

I rarely have a chance to put it to use; for some reason, my locale, next to a rather heavy truck route, apparently just doesn't suffer from impulse-type noise much.

Ditto here near San Lorenzo. I use an MFJ-1026 to help reduce that stuff, but there's enough of it on LW so that it's impossible to remove entirely.

Hi Bruce,
I see you're on the other side of the bay from me, in San Lorenzo.

I don't know if Preamp 2 has been "publicly" commented on, but I looked it up and it's an integrated circuit preamp designed for VHF usage; no special features about it other than its rather large gain. Its performance specs are mediocre, at least for overload resistance, as would be expected from an IC, low-current preamp. Of course you can use it for HF, or MF, for that matter, as long as you realize it's much more subject to generating distortion from overloading. I've personally not found a need for the extra gain for my particular receiving usages, and the couple times I tried it found definite overloading distortion.

Reception of LF is not a trivial matter, mainly due to so much noise from the house field and nearby powerlines, not to mention all the electronic gadgets folks use these days--light dimmers, electronic light bulbs, motors, etc. Passive wire antennas are very inefficient at LF, unless a wire of 300 feet or longer can be strung. I use an active whip antenna for LF; it's very efficient. I have a wire antenna I use for MF and HF.

I have no idea why your FRG100 gives less AMBCB IMD in the LF region than your R75; they're both similar radios. I don't own a FRG100, but would certainly like to compare it on LF to other radios I have (AR7030, R71) which all give more or less the same results on LF. I like the R75 since its noise blanker works so well. Here in the SF Bay area, I've found that some LF AMBCB garbage is not actual IMD generated in my antennas or receivers, but is actually radiated and picked up by my antennas. Perhaps nearby rusty joints are rectifying the very strong AMBCB signals and radiating them. I can hear the same type of signals even with my totally-passive wire antenna, indicating it's not being generated in my setup.
If I want a nice quiet noise floor, especially for LF listening, I drive to the nearby coastal hills, where I have a spot near Big Basin State Park I setup my antenna and listen in the car.

Yeah - and OH! By the way, my friends and I are probably going to be at Montebello Open Space tonight with our telescopes. A short hop for you - if you wnated to visit and see some stellar stuff in pretty big scopes, you may want to stop by. If you decide to go, give me a phone call by about 3:45 PM to be sure I am going - (510) 276-7780..anyhow...

>I don't know if Preamp 2 has been "publicly" commented on, but I looked it up and it's an integrated circuit preamp designed for VHF usage; no special features about it other than its rather large gain....I've personally not found a need for the extra gain for my particular receiving usages, and the couple times I tried it found definite overloading distortion.<

On low freqs, it's definitely true - but higher, it's great for Asian stations. It sure helps Sri Lanka!

> Reception of LF is not a trivial matter, mainly due

I agree. My SW antennae are very weak on LW - I can only hear a few local stations as a rule.

>I like the R75 since its noise blanker works so well.<

I just discovered that in a big way - some horrid S9 noise was fouling my 19 meter reception this noon, and the MFJ-1026 only marginally helped (again, I need to tinker with the antennae), but when I tried the NB, whew! - the noise signal dropped to S1, and a mess of stations popped out from nowhere. After that, the sun

apparently messed up the bands because they became practically silent, but nonetheless...

> Here in the SF Bay area, I've found that some LF AMBCB garbage is not actual IMD generated in my antennas or receivers, but is actually radiated and picked up by my antennas. Perhaps nearby rusty joints are rectifying the very strong AMBCB signals and radiating them. I can hear the same type of signals even with my totally-passive wire antenna, indicating it's not being generated in my setup.<

I get the same thing here, especially the last several days. My BCB filter, which obviously cuts the strength of MW signals by 50 to 80 dB, has little effect on the harmonic slop that runs up as high as the 31 meter band. I'm not sure where the problem lies here; I need to look around a bit for it.

> If I want a nice quiet noise floor, especially for LF listening, I drive to the nearby coastal hills, where I have a spot near Big Basin State Park I setup my antenna and listen in the car.<

Sounds great - cities just suck, I guess, for many reasons. Next summer, I'm going to bring the whole shootin' match up to our star party at Lassen and see how it goes up there at 8,000 feet :-)

833. Comparison between Icom R8500 and R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-08 08:50:35 UTC
From: r7y528@home.com
Topic: 833 Message: 833

I did the comparison between the Icom R75 and R8500 this afternoon. This isn't a scientific comparison, its just my fiddling with the two radios side by side, with a switch connecting both to a beam on the roof. I started at Wednesday afternoon at 3:15 pm PST in Sunnyvale, CA, USA.

I only compared reception of selected frequencies. I didn't do any scanning or searching. The R75 didn't have the DSP option.

First test was WWV on 5,10,15,and 20 MHz. 5 didn't come in. 10 was noisy and weak on both radios. 15 and 20 were strong and clear, free of noise. Reception appeared the same on both.
Then 21.740 and 12.095, sound quality on the R8500 was clearer.
14.100 came in very weak with lots of noise on both radios.
Later in the afternoon I listened to some conversations on 14.325. Here the R75 worked better. There was some noise on the frequency from another signal. Using the Twin Pass Band Tuning to shift to the right, the noise went away. The IF Shift control on the R8500 should have had the same effect, but didn't. I didn't find any other signals where the Twin pass band tuning was needed.

I tuned in a beacon on 28.214 which was clearer on the R75. Another beacon on 28.189 sounded the same on both radios.

I got a little milcom on 11.175. both radios sounded the same, although the R8500 may have been a bit clearer. There was a lot of noise. I could hear the coded message characters though. (3 ☐ O U V 7 H G Q)

I also tried am broadcast, KCBS 740 am (a major Bay area broadcaster) came in fine on both radios.

The first preamp on the R75 helped several times. I didn't notice any difference using the noise blanker or the AGC buttons. The Attenuator knocked some signals off entirely. Preamp 1 helped, preamp 2 only added noise.

The buttons on the R8500 were easier to use. They are larger, spread farther apart, and seem to push better. The tuning knob on the 8500 may be a bit smoother also. I did use the tension adjustment on the R75 tuning and it felt pretty good. The display on both radios was sharp and easy to read.

Overall, the speaker on the R8500 sounds better than the R75. But with the Icom SP 21 external speaker, the R75 sounded very

good. The R75 with this external speaker sounded better than the R8500 using the speaker. The sound on the R8500 may be muted a bit.

After about two hours of listening I decided on the R75 and ordered one. I also ordered the DSP option. One factor that played into the choice is that I can also buy a VHF/UHF radio like the Uniden 780XLT which also has Trunk Tracking and still end up paying less than for an R8500.

I'd like to say thanks to Ham Radio Outlet in Sunnyvale, CA. They set up the two radios and an antenna splitter and let me play with the them for more than two hours.

Frequencies checked were 11.175, 8.906,8.825,6.671,8.992, 5.696, 4.747, 5.000, 10.000,15.000,20.000, 13.650, 13.670, 21.740, 21.740, 12.095, 9.950, 11.985, 14.235, 14.100, 24.900, 28.214, 28.189, 14.300, 2.863, 6.679, 8.828, 13.282, 3.330, 7.335, 14.760. unless mentioned, nothing was heard on most of these.

Mike,

Any comments from HRO on the their own comparison of these two receivers?

That question should go to r7y528, who wrote below:

I didn't ask HRO what they thought. I have my own interests in listening that could only be resolved by comparing the radios myself. Too often, when I've asked in other groups what people think of the two radios I get opinions that don't relate to my interests and therfore are of no use.

842. Preamp 2

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-11 17:18:07 UTC
From: Simone Meggiato
Topic: 842 Message: 842

Hi all,

I see that Preamp 2 is not well considered by some IC-R75 owners ("it adds noise only"; "it's designed to work on VHF bands"; etc.). As in my experience it's true that in many cases it is of no help in "pulling out those weak signals" - (c) Icom - but I found it very effective on LW band. Since a few days I'm testing LW reception with a discone antenna (I know it is not exactly the right antenna for LW but I like it because it is less noisy than my Dressler active antenna and than my short dipoles); on many weak (of course, with a discone...) signals, setting Preamp 1 improves the reception a little... but setting Preamp 2 the reception improvement is really dramatic. Preamp 2 seems to me even less noisy than Preamp 1 on LW.

Hello All -
One more thing - I have read the description of the attachment of a wire to pin 23 of the IC. From the way it is written it sounds like the pin can be lifted just by using the small bit screwdriver. Does this procedure also involve desoldering the pin at the same time? Just trying to make sure. Thanks.

73,
Bruce K6RQR

Uhm, I'm not sure that a low profile SO IC can be reliably "clipped"; anyway some years ago I bought a couple of clips for classic DIL package and if I remember well I bought them from RS, perhaps they have something that works for you.

>One more thing - I have read the description of the attachment of a

>this procedure also involve desoldering the pin at the same time?

I lifted it up while heating it with a low power thin point soldering iron (I used an 11W one but every thin point <=30W soldering iron, as described in Rado's intructions should be ok). If you don't heat it while lifting the risk to break the pin at the IC side is surely higher.

From: wgessley@kcnet.com
Topic: 848 Message: 848

I've read the earlier post regarding the use of a 9:1 balun for using 50 ohm coax to connect a longwire to the R75. However, in my suburban location I am interested in a simple END-FED longwire which (correct me if I'm wrong) is unbalanced. I've read about 'un-un' baluns. Is this what I need? Isn't this just a transformer? Can anyone recommend a particular one to buy? I've also read that some, but not all, baluns can be used like an 'un-un' balun by grounding one of the connectors.

Thanks,
William

I simple transformer with a 3:1 turns ratio will be fine, but a trifilar wound transformer will perhaps give a broader frequency coverage.

William,

What you are interested in is, indeed, an un-un. A plain ol'
matching transformer can also be used, but a real balun is a
very different animal.

You may want to contact Cable-X-Perts (www.cablexperts.com) for
an ICE 180A transformer. (ICE == Industrial Communications Engineers)

(They aren't listed in their online catalog. You can see a picture
of one of these at ICE's *old* web site:

http://personal.isla.net/ice/model_100a.htm

(Their new site seems to be down.)

You can read opinions on the commercial matching xformers, pro
and con, at:

http://www.hard-core-dx.com/nordicdx/antenna/feed/index.html

(Down near the bottom.)

Regards,

Eric

Well, my radios are right next to my computers and I don't hear the computers at all. The feed point is over the garage and I have 2 ea 50' Radio Shack RG58 cables with a coupler in the middle running over the roof, through the attic, out the furnace door, and along a baseboard. Just like the discone scanner feedline. I wouldn't even consider running RF into the main room without using co-ax.

A random wire is high Z except when you're radio happens to be tuned to a resonant frequncy (hence the term "random"). Feeding high impedance RF into a low impedance pipe is always verboten; and not violating this basic rule makes me happy.

Simone,

While I was doing Rad's mod. I took a look at the dial. It is a "self contained" unit, and I could see no set screws. I think the only way you can get to it is to open up the receiver and remove the front circuit board.

Good luck,

Rado's mods are the main reason for which I wouldn't like to remove the metallic shield of the front circuit only to see how the dial is retained; the little pcb board I used to implement mods 2.0, with its thin cables that go to the fragile pins of the MC13022A, is nicely attached to the shield through a rugged adhesive pad ;-).

858. Re: [icomr75] Main Dial

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-17 06:26:56 UTC
From: Radostin Danev
Topic: 854 Message: 858

Hi Simone,

The knob on the dial is held only by friction (there is a flat spring). Removing the knob is done by simply pulling it (hard enough). Then you'll see the nut holding the encoder. I don't think however that there is an easy way to tilt the axis of the encoder. In my case the knob is not perfectly centered on the axis of the encoder so when turning the dial it wobbles a little. This is not bothering me at all.
When I was modifying my R75 the last time I disassembled the front unit completely. Also disassembled the main dial encoder and replaced the grease with special perfluorinated grease (lasts forever). Another thing I did was grounding of the case of the CPU clock x-tal. (call me perfectionist)

Best regards,

Rado

859. Tip: Washing the main dial rubber ring

861. PBT problem

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-18 09:05:41 UTC
From: aunumero13@aol.com
Topic: 861 Message: 861

My "technical" english is not very fine... sorry if it's a bit broken.

Something strange happens when I'm using the PBT in REVERSE CW mode.
It's a bit hard to explain...

Assuming I'm listening to a stable and continuous CW signal (a LF
beacon carreer for example), the INNER twin PBT control works fine.
If I turn it from left to right (or right to left), it narrows the IF
passband as it should do. HOWEVER, I have noticed a whisteling when
both controls are at center position ; It disappears as soon as I
move one control (the frequency must be very "quiet" to notice that)

BUT, when listening to the same signal, using REVERSE CW, this inner
PBT control seems to work as an ATTENUATOR ; I mean the audio volume
decreases by half if I turn the control from left to right (as if I
was adjusting the volume knob).(I'll try to make a recording, it says
more than words.

Have you noticed the same ?

Using a SSG, I tried to adjust the PBT Volume (T.M, chapter 4-4 SET
MODE ADJUSTMENT > Connect an SSG to the antenna and set as F=
14151.5, level=50mV, Mod=OFF, both controls at center position)
Well, nothing changed. I can still hear the whisteling on "normal" CW
mode when both control are at 12 o'clock, and the inner control still
make the volume decrease by half when using REV CW mode.

Filter used : FL-101 250 Hz [9 MHz)
My unit is fitted the the optional DSP

How can I fix the problem ?

Sorry for my poor english...

Pat, south-east France.

862. Articles on maximizing receiver selectivity

Yahoo group: icomr75 (2000 — 2002)

From: r7y528@home.com
Topic: 862 Message: 862

There's a very interesting set of articles in the Feb and Mar '01 QST by Larry Scheff on how to maximize your receiver's effective selectivity.
The writer wrote about using the Kenwood TS-940S using Variable Bandwidth Tuning, and the Kenwood TS-440S using Passband Tuning.
He talks about noise levels, filters, AGC, Attenuation and other controls.
While very complex, I understand the articles tell how to get much better recption and should work with the likes of the Icom R75 and 8500.
I haven't tried it yet as I don't have my radio with me.
The articles are on Pg 42-48 of the Feb '01 QST and pg 44-47 of the March '01 QST.
Hope this is of use to the group.

James

Thank you, I removed the knob. The shaft of the encoder is perfectly coaxial
and straight as far as I can see but the way the knob is attached does not
allow a perfect alignement to the encoder shaft. I don't see any practical
way to correct this, so I've decided to keep it as is.

> way to tilt the axis of the encoder. In my case the knob is not perfectly
> centered on the axis of the encoder so when turning the dial it wobbles a
> little.

Exactly the same thing that happens here.

865. BCB Dxing & portability

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-20 22:25:24 UTC
From: lew47oz@yahoo.com
Topic: 865 Message: 865

Greetings all from South Australia. Being a dedicated BCB Dxer, I would like to know of any other members who pack up the gear, and head off any time allowing, to hunt those elusive stations, be it X band or other. What do you use in the way of antennas, phasing units, preamps,or other auxillary gear. What mods have you done and do you use lead acid, gel cell, solar panels or what!! to power the gear. It will be great to share ideas.
Cheers Lew Chapman

866. Does the DSP Option really work?

Yahoo group: icomr75 (2000 — 2002)

g'day all

have been reading many of the posts to this group and have just joined

i do not yet own an R75 but i have an IC 746 transceiver which shares much of the receiver circuitry, also have an R71 which is the ancestor receiver.

i have ordered the 2.8kHz 2nd IF filter(9MHz) as well as the 2.8kHz 3rd IF filter (455kHz) for the 746 and will report on these once installed and in use.

my question is simply, are we being conned by icom on these DSP units? are they providing significant increased intelligibility over a well designed communications receiver, or is it just great marketing coupled with a cheap way of reducing excessively high broadband noise from the IF amplifier due to inferior 3rd IF filters?

comments appreciated

Heh! Gert, you must live in a quiet rural place.
Here in the city/suburbs, I never shut mine off - the
noise would kill me if I did. Not only do I use it, I
find that it's adjustability comes in handy too. It's
not the be-all and end-all of noise reduction, but
with the high-noise environment in which I must
operate, it has an honored place in my NR arsenal.
The accompanying autonotch works pretty well, too.

869. RG6 with HF

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-21 16:42:21 UTC
From: wgessley@kcnet.com
Topic: 869 Message: 869

I use RG6 (75ohm, foil shield) for all of my shack's lead-ins and terminate to f-connectors. I use f-connector adapters to convert to PL-259 or BNC as needed. This system is cheap (10 cents/foot at Home Depot), provides low db loss, and is flexible (I can easily swap cables between BNC scanners, PL259 HF receivers, home-brew crystal sets; I can use CATV switches, etc.).

Question: is this significantly reducing the performance of my R75/longwire setup? I am using an 'un-un' balun to match the coax to the longwire.

Thanks in advance.

William

Sounds good to me. As long as you're not transmitting, the mismatch is immaterial. A $15 "A, B, C" switch is very cool.

I've yet to find a DSP that increases "intelligibility". My brain is still the best filter for that. The NR does make long term monitoring less fatiguing. I think where DSP NR really shines is in the digital modes e.g. WEFAX.

On the contrary I find the NR very useful (if set between 1 and 5). The ANF
is also useful but it doesn't work with high frequency audio signals.

874. 450 KHz Ceramic Filters

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-21 22:32:41 UTC
From: Ian Johnson
Topic: 874 Message: 874

I have just had an email from Hy-Q International here in Australia in response to my query on the availability of 450KHz ceramic filters which can be used to upgrade receivers like the Icom R75 and the ATS909.

I was particularly interested in the equivalent of the muRata CFWS450I and CFWS450IT.

To my surprise, they can supply. And at rather less than US$40 (ahem). Previous queries resulted in "no-can-do" or "$2 each if you buy 500".

LTU450IT UNIT COST A$2.70 each (3 terminal. may be useful for some).
LTW33-450I or IT UNIT COST A$2.70 each (equiv CFWS450I & IT)
LEAD TIME FOR EITHER 4 - 5 weeks

Costs are in Australian $ and GST of 10% is added for Australian sales.

More info' see www.hy-q.com.au or email sales@...

Yeah - I believe it's designed to notch out freqs that fall on the range of the SSB filter (2.4 kHz). Much above that level and it doesn't do much. One place where this really causes me trouble is on the 60 meter band between 5015 and 5035 MHz, where you have Solomon Islands, Radio Rebelde and that US-based religious broadcaster all within 10 kHz - those guys splatter all over each other and are difficult to separate even on SSB. I sure could use a 4 - 5 kHz notch there. Even the Passband doesn't take them out well.

Hello Sam,
I also have both an R-75 and a 746. I believe the R-75 uses an AF DSP while the 746 uses a DSP in the IF. An IF DSP is supposed to be better, but I haven't found that to be true with these 2 rigs. Both work great at ANF. While listening to SSB signals, if some idiot decides to tune up on frequency, or if some SWBC begins to broadcast a few kHz away, I just press the ANF and the heterodyne disappears. The Noise Reduction is a bit trickier. On the R-75, I use it in conjunction with the RF gain and volume control, but never turn it beyond about 1/3 full scale. On the 746, I rarely use it because it seems to be much worse at creating the "waterfall" sound effect. If you do a lot of ham listening, I think you'll want the DSP at least for the ANF, unless you already have an external DSP.

You'll be right at home with many of the controls of the R-75 as well as the button pushing style both radios. The twin PBT works just like the 746 (but no graphical representation of which side you're moving). A few other things I miss are no automatic sideband switching when tuning through the frequencies and no bandscope to easily search out transmissions.

From my experience, I think the R-75 is right up there with the receiver on the 746 and the front firing speaker is better than the top firing speaker of the 746. It's pretty weak for broadcast listening, but quite good for ham listening. If you want great sound (and the R-75 can produce great sound), get one of those $39 RCA speakers when they go on sale for $19 at Radio Shack. It also makes the 746 sound great.

Let us know what you think of the R-75 when you get it.

877. Installed Rado's v2.0 AM-sync mods

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-23 08:07:38 UTC
From: jgedde@bestweb.net
Topic: 877 Message: 877

Hello all,

I just built and installed Rado's sync mods. First off, let me say that I did not use the 2SC458's he recommended. I used MPS6520s available at Radio Shack in packs of 15 as 276-1617.

After installing it, I found that the sync detector worked as it did with mod version 1.1 in SA sync mode, but it never detected lock in En mode. In other words, in En mode, the S in S-AM always flashed.

I made measurements of the circuit and found that there wasn't enough base current out of Q1's base to kill off the Icbo leakage and turn it off.

I got it all to work by changing Q1's 100k base resistor to 50k (simply by parallelling another 100k). Now it works fine and exactly as Rado describes.

I am not sure, though, what the 2.2k resistor on the collector of Q2 does. The SS line is only pulled high by a 47k resistor, so collector current should be small even without the 2.2k. I guess it makes a good safety factor if Q2 shorts, though, as it won't take out the whole 5v supply...

I feel that the circuit is a bit tempermental and relies too much on the beta of Q1. Since Beta can and does vary between identical transistors and varies with ambient conditions, Rado's circuit may be a bit marginal. My mod may have worked simply by changing Q1 out with another from the same pack!

I propose using an open-collector comparator (like the LM293, or LM339) to pull down the SS line. Since the input impedance of a comparator's (+) input is VERY high, even with hysteresis resistors, it won't load its input source.

I have uploaded my proposed circuit. I haven't built it yet, and may not have time to do so for a while. I also uploaded my design calculations for those who want to review them....

Regards,
John Gedde

Topic: 877 Message: 878

I decided to build-up the circuit anyhow. I used an LM339 from Radio Shack rather than the LM393. I had to change a couple of resistor values to get it to work reliably. I had to decrease the amount of hysteresis, and raise the comparator setpoint.

It all seems to work fine. I uploaded a final schematic and will upload a photo when I get a chance.

Regards,
John Gedde

Yes, it is temperamental. I tried to keep it as simple as possible. I was also thinking of using a comparator but as it worked from the beginning with the transistors I did not bother to develop further.

> I have uploaded my proposed circuit.

Thank you for this! Finally I feel no longer alone at modifying R75. I think we should leave only your circuit as mod v2.0 as it is much more robust. I have two questions/comments:

1) R2 (4.7k) seems a little bit small value for positive bias on pin23. I found that anything below 10k will hold pin23 permanently high.

2) It will be more flexible if R4 is replaced with resistor + trimmer. Thus the user can adjust the threshold to his liking.

Best regards,

Rado

One more thing ... I think a safety resistor (like 2k) on the output of LM339 (pin1) won't hurt. Imagine a condition when pin15(SS out) is low and the output of the comparator is high. This will load the REF3V line a lot. Such condition is unlikely to occur during normal operation, but what about transient (power on/off)? Better to be safe.

Rado

Ooops ... just checked the LM339 datasheet - it is open collector output. Ignore the above comment.

Rado,

Oops, you're right! I didn't mean for R2 to be 4.7k. The 22k value
you came up with works fine. I have changed this and uploaded a new
value.

As far as your R4 trimmer + resistor idea, I think it's a good one.
Not only does it allow for user preference, but it takes into account
the effect the tolerance, ESR and leakage of C1 has on the DC voltage
at the comparator. I have added this suggestion too.

Regards,
John

Rado,

Here I must disagree. The output of U1 (LM339) is open collector, so it doesn't actually go high unless something pulls it there. Furthermore, it limits the swing on the output pin of U1 and changes the designed hysteresis (see calculations).

John

This is a picture of the LM339 S-Am mod installed in my R75. The two
black circles on the PCB are leftover RTV adhesive used to hold the
capacitors from mod v1.1. The caps are now on the small vectorboard.

All of the parts I used are available from Radio Shack, including the
IC and the vectorboard.

Regards,
John

Greetings all I have posted a pic of my R75 during DXpedition at prime South OZ site . Also a couple of Kaz antenna & transformer pics (is this allowed)
Cheers Lew

890. R75 Twin PBTs question

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-11-28 00:18:45 UTC
From: bpnjensen@yahoo.com
Topic: 890 Message: 890

Hi, all - I have never owned a radio with a passband shift control before, let alone two of them, and so I have assumed that the way these things operate on the R75 is the correct way. But let me say this, and ask you a question...

When I adjust either one on SSB, the signal obviously is changed. Both work effectively to alter the tone, but (it seems to me) less effectively to remove offending adjacent channel signals before making the desired signal unintelligible. Sometimes it works, but it is not as common as I would have originally thought. As a matter of reference, the point at which the signal loses most intelligibility is about one half way between dead center and full right or left (true on either inner or outer PBT, whether adjusting up or down). This depends STRONGLY on the relative strength of the desired signal. And sometimes, the offending adjacent junk is still there after turning the knob. I never thought a modest removal of tones woudl be so damaging to the main signal.

So the question - is this the way it is supposed to be? Is the PBT really only good on POWerful signals? Or do I have a malfunction (either radio or operator?)

thanks,
Bruce Jensen

Just the stock filters - 2.4 kHz SSB. BTW, I noticed
for some unfathomable reason that it works better on
amateur voice transmission (and amateur transmission
in general) than on ECSS reception of AM Broadcasts.

Date: 2001-12-05 03:17:36 UTC
From: blair@hart-photography.com
Topic: 894 Message: 894

Anyone use RadioCom Softare for controlling an R75?

Or, more similar to what I'm trying to do--control both an R75 and an R7000?

Thanks,

blair

896. Have just done mods 2.1

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-07 23:52:51 UTC
From: Simone Meggiato
Topic: 896 Message: 896

Hi all,

for who is interested, I've just done mod 2.1 and it works fine; whines during tuning, after proper setting of the trimmer, are even more short, compared to 2.0. I used a LM339J (by TI), I looked for a smaller dual comparator IC but my electronics' reseller had already finished his supplyes.

897. Optional Filter Advice Question

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-08 15:38:02 UTC
From: just_rtfm
Topic: 897 Message: 897

hello!

for ECSS broadcast listening are the 2.8 kHz or 3.3 kHz filters very useful? has anyone measured the actual values for ICOM's filters? which of the two is recommended? and why? can a difference be readily heard over the stock 2.4 kHz? are they used as a primary or 'special cirucumstance' filter? i have read what i could find on the subject. bottom line: i am unsure if its worth purchasing one of these filters. in my mind the 3.3 kHz seems too wide and the 2.8 kHz seems very close to stock, although 400 Hz more audio range is pretty significant. please share your thoughts especially if you have owned either or both of these optional filters.

much thanks,
phil

898. Re: [icomr75] Optional Filter Advice Question

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-08 16:11:59 UTC
From: Gert Nilsson
Topic: 897 Message: 898

First let me tell you that I always listen with the widest possible filters. I also tune all AM stations in the ECSS mode. I have the 9 MHz 2,8 kHz and the 3,3 kHz 455 kHz filter. In the normal position I used the 3,3 kHz following the 2,8 kHz filter. A very nice combination. I almost never used the 3,3 kHz which I had alone in the wide position. It is a very good filter, much better than the 9 MHz filters. On the Icom Europe webpage you can find the graphs for the 9 MHz filters. The 2,8 measures 2,9 and 5 kHz at the 6 and 60 db I think. Nowadays the old FL44 from my R71 has replaced the 3,3 kHz filter.

I think there is a big difference between the 2,4 kHz filter and 2,8 kHz. These 400 Hz make a big difference in AM ECSS. For SSB in the amateur bands the 2,4 may be better.

From: just_rtfm
Topic: 897 Message: 899

Gert,

thank you for your comments, they confirmed my hesitation to get the 3.3 kHz as i usually switch to ECSS in an attempt to wipe out adjacent interference. i would probably stay in this mode if the stock filters did not cut the audio fidelity so much. what do you think about the combination of 15 kHz (9 MHz IF) and 2.8 kHz (455 kHz IF)? the 2.8 kHz in the 9 MHz IF is cheaper, does it matter which IF it sits in? if you have time could you give me your opinion on the sound difference between 2.4 kHz - 2.4 kHz (stock) versus 2.8 kHz - 15.0 kHz in your R75 using ECSS?

thanks again,
phil

900. Re: [icomr75] Re: Optional Filter Advice Question

Topic: 897 Message: 900

The earlier in the signal bath you have the selectivity the better .... but..... the 455 kHz filters from ICOM are much better than the 9 MHz filter.

I have friends using 2,8 kHz filters in both IFs. They think it is fabulous! The effective bandwidth is maximum 2,6 kHz at -6 dB.

The original 2,4 + 2,4 is effectively just around 2,15 kHz wide and I think it is too narrow. With optional filters you have more combinations!

Hello Phil,
A <real> email address for Phil? :-))

Question: you keep talking about the ecss mode. I take this to mean that you tune in ssb until you have a good signal, then go to AM?

I'm sure glad you are asking all of these questions! If (when?) you ever buy a filter, I'm following your lead for BC Band stuff!

From: just_rtfm
Topic: 897 Message: 902

Marv,

how goes it? yes i am still looking into filters... Gert has given some good advice... probably will go with the 2.8 kHz in 2nd IF... the 1.9 kHz you have in the 1st IF sounds like a pretty nice one for amateur bands... i might have to get that down the road too.

ECSS (exalted carrier SSB reception) is simply the reception of AM signals as if they were SSB. 'normal' AM is made of two sidebands and a carrier. typically i tune the radio using AM mode (15.0-6.0 filters)... when there is interference on one side you just hit SSB and use USB or LSB, whichever is away from the interference. if the voice sounds like donald duck you have to tune using the 1-999 Hz segment to correct it. my R-75 seems 'right on' so i rarely have to fool with it... it also does not seem to drift much. one thing nice about tuning in a USB (or LSB) is that it's so narrow you're either on-carrier or not... unlike the 6.0 kHz filter where you can sometimes tune three places and still hear the station. btw, synchronous detection is essentially 'automatic' ECSSB reception.

i have been using earbuds (will eventually get that ACS340 altec lansing speaker set) with ECSS and the sound is excellent. the small (and well protected) speaker on the unit does not do the receiver justice... get some cheap earbuds ($15) and check it out. one word of caution though: turn the volume down while tuning, hitting a hot station can be LOUD!

phil

903. FL-102 Filter Usage - Help Needed

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-14 20:35:38 UTC
From: just_rtfm
Topic: 903 Message: 903

hello group!

ICOM sells a filter for the 9 MHz IF that is 6 kHz wide designated the FL-102... apparently for use in their IC-775DSP receiver. is it possible to use this filter in my ICOM R-75? will it just plug-in? my thinking is that it could replace useage of the 15.0 kHz wide filter in the filter combinations and allow PBT narrowing on 'AM'. my idea is to use this filter with with optional 2.8 kHz filter in 455 kHz IF as follows:

AM norm 6.0 - 6.0 <--- PBT ~4.7 to 6.0 kHz
AM narr 6.0 - 2.8

SSB wide 6.0 - 2.8
SSB norm 6.0 - 2.4
SSB narr 2.4 - 2.4 <--- PBT ~1.1 to 2.2 kHz

any input is welcome! thank you,
phil

From: just_rtfm
Topic: 903 Message: 905

Gert:

again i want to thank you for your input. my thinking with this whole FL-102 (6 kHz @ 9 MHz IF) drop-in filter is that i could use it in place of the 15.0 kHz to narrow down the AM bandwidths.

using AM with 6.0-6.0 filters and utilizing the twin-PBT will allow ~4.7 to ~6.0 kHz. this is 'equivalent' to two sided SSB of ~2.35 to ~3.00 kHz on SSB. this is pretty significant narrowing and not a bad deal for one $90 filter. if this still doesn't knock out interference then the twin 2.4 kHz on SSB is there.

i am unsure how i would 'tell' the ICOM via menu that i am using the FL-102. its too bad i don't know an ICOM dealer willing to let me pop all these filters in and record the audio to mp3 for everyone to hear.

my other option remains using dual 2.8 kHz filters... you suggested this setup for ECSS use and i feel it was very good advice. your comments have been much appreciated.

phil

906. Re: [icomr75] FL-102 Filter Usage - Help Needed

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-15 17:12:45 UTC
From: Alan Johnson
Topic: 903 Message: 906

Hello:

The FL-102 is a direct dropin for the 9Mhz filter slot. I selected the 9 MHZ 0.5 selection in the filter setup menu as this gives an IF frequency that is closest to the filter's center frequency. There is a slightly noticeable improvement in selectivity with the 6 vs. 15 khz filter in the 9 Mhz and with the 6 in 455 khz, but no noticeable difference in the PBT. I haven't tried using the 2.4 filter in the 455 khz, as I use the FL-257 for narrow AM.

73,
Alan Johnson

From: Gert Nilsson
Topic: 903 Message: 907

The 15 kHz filter used is in front of the normal 9 MHz filters. When you chose 9 MHz 15 kHz this means the 9 MHz filter bank is bypassed. The FL102 will be used in series with the 15 kHz filter. This filter is a 2 pole x-tal filter 12 kHz at -3dB I think. Icom sells both 6 and 8 kHz filters directly interchangeble. I use a 6 kHz filter in my R75.

908. replacement narrow crystal filter for 60MHz first IF

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-16 11:59:51 UTC
From: sam_dellit_vk4zss
Topic: 908 Message: 908

some years ago a friend of mine modified several icom r71a receivers by removing the very wide 2 pole monolithic crystal filter for the first IF and replacing with 2 discrete crystals custom ground by HyQ in melbourne with a designed passband of about 6kHz. the mod was very successful and greatly reduced the close in dynamic range problems.

the r75 ist IF filter is just as broad as the r71 so i was wondering whether anyone had attempted the same mod on the r75 or whether kits were available to do this for the r75

i am no RF expert but i will attempt to answer your question: your idea will work if you change say the 15 kHz filters to something lower in the IF chain. this will however hurt FM which for many of us is not a big deal. the 60 MHz filter you spoke of is low pass filter meant to keep out anything above 60 MHz such the rest of the UHF/VHF 'noise'. if you change this particular filter to something lower than 30 MHz you won't be able to receive some of the shortwave (HF) spectrum. your idea sounds tempting if you change those 15 kHz filters to something like 4 kHz and only use ECSS tuning... anyone here know if that'll work?

The 69 MHz filter follows the first mixer. This is not a low pass filter. It is a 15 kHz wide bandpass x-tal filter. Then follows the second mixer and a 15 kHz 2-pole x-tal filter in the 9 MHz filter in front of the noise blanker. This filter is in use in all modes. Icom have 6 and 8 kHz versions of this filter, used in some transceivers. I have a 6 kHz filter in my R75. I never use FM!

There are 60 MHz filters at the antenna input, but these filters have nothing to do with selectivity. Their main object is filter out stations at the image frequency!

Does anybody have any specifics about the "free" UT-106 DSP option
"rebate" from Icom? Like what are the dates involved in-between which
you must buy the receiver to receive the "rebate"? I have been
trying
to access the Icom America site lately, but with no success.

Thanks in advance for any information.

Jack

Hi Jack:

I just purchased an R75 from AES in Milwaukee. They gave me a rebate coupon for the UT-106 that was valid from November 2001 until 3/31/02. They also said it takes about 3-4 weeks to get the UT-106 once the coupon and sales receipt are mailed to ICOM.

Topic: 908 Message: 919

The 69 MHz filter and 9 MHz and optional filters are all x-tal, the only ceramic are the 450/455 kHz filters 2,4, 6 and 15 kHz filters,

I do not know any subsitute for the 15 kHz filte at 69 MHz.

The 15 kHz ahead of the noise blanker is easily removed. ICAM dealers have 6 and 8 kHz alternatives.

KIWA electronics have a 3,7 kHz filter at 450 kHz. I have not tried this.

Also Murata has other alternatives for the 2,4 kHz 455 kHz filters. They are called CFJ455K and an additional figure. I think the 8 is a 1 kHz filter (perhaps a little widwr, maybe 1,6 kHz)

920. SSB/ECSS HF Receiver

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-24 08:56:16 UTC
From: just_rtfm
Topic: 920 Message: 920

just a thought: why doesn't ICOM make a HF (30 MHz max) receiver that only does SSB and ECSS? 1000 memories, make the unit smaller, dump the speaker, DSP standard, change the two 15 kHz filters before the NB to 3 kHz, get rid of the 6 and 15 kHz filters, no synch AM, no FM. replace the dual 2.4 kHz with highest quality dual 3.0 kHz that can be twin-PBT down to say 0.5 kHz. they could have two modes for the PBT... the second mode could allow the inner ring to move both together, the outer ring to move both opposite... it would save the later's position as a type of bandwidth reading. sell it for $400 and watch the competition die. make a $100 add in board based on R2 to do 30MHz - 1GHz FM. anyone have any thoughts on the idea?

phil

This filter works well.

Murata K-series ceramic filters for 455KHz IF:

Name
CFJ455K8 1.0 KHz nominal, 1.5 KHz actual -- poor shape factor (3.0)

CFJ455K14 2.2-2.6 KHz (depends on sample?) -- good shape factor (1.73 - 2.05) **

CFJ455K5 2.4 KHz nominal (probably 2.7 actual) -- good shape factor (1.88) *

* IIRC, this filter already comes stock in the R75.

** This one comes stock in the AR7030+ -- a 1.46 shape factor is obtained due to cascading filters.

My experience with them is that they lie about stock status and/or lead times to obtain out-of-stock items. They also have no qualms about repacking and reshipping returns as new items. However, in fairness to Universal, I should mention that they will accept returns, they have reasonable prices, and have the best website for any radio store.

>and have the best website for any radio store.

Universal is the only place I know that actually has
images of the accessories available from ICOM.

and....

My most recent order with an unamed Ham Radio
dealer still has me confused.

I ordered a transceiver and antenna. The Transceiver
arrived but no antenna.

The web site does not notify you of this backorder
either at the time you place the order and by the
way you have no receipt in the box that lets you
know it's been backordered. A receipt comes in
the mail weeks later that says you have paid for all
the things you have ordered but guess what? No
mention of any backorder is on the receipt.

Then, I get a letter a week or so later saying my
antenna was backordered.....but no expected
date is mentioned.

Then, two months later I get the back ordered
antenna that had already been paid for two months
earlier.

Now, I can finally install the transceiver I ordered
two months earlier now that I got the antenna that
hooks to it!!!

This is a one of the big three Ham Dealers and goes
by a three letter name.

I give up.....

924. 6kHz filter @ 9MHz IF ?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-26 18:41:27 UTC
From: gear2box
Topic: 924 Message: 924

Folks--

I'm a new R75 owner, but have been following the board here for a few months. The unit straigh-from-the-box works a bit better than i expected, but i plan to forward it to Kiwa as soon as i can get on their schedule.

Which brings me to my question: assuming that one had no need for FM and was primarily interesed in broadcasts, wouldn't a 6kHz filter in the 2nd, 9MHz IF make a lot of sense? Then the PBT could actually do some good at a broadcast-type bandwidth. Any disadvantages to this? It might do some good things for selectivity also, but that wouldn't the main reason to make the change.

I'm given to understand that the ICOM firmware wouldn't recognize such a filter if it went in the optional slot. Assuming this is so, why not just get Kiwa to exchange the 15kHz filter in the second IF with a 6kHz one (same as they will do for me in the third IF while installing the 3.8 kHz filter)? Are 6kHz filters available at 9MHz frequencies? I can't find one in the online Murata catalogs, but admit i'm no engineer. (Actually, i'm an economist . . . hold the snickers.)

Any thoughts on the above would be appreciated.

926. New R75 Owner has Questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-27 17:31:47 UTC
From: xoxo2200
Topic: 926 Message: 926

Greetings all,
My name is Steve and am presently awaiting arrival of a new R75. I do hope I can tap into your collective experience on a few concerns.

1) I have an MFJ active preamp/preselector which is used with a longwire antenna. Is this overkill considering the R75 has 2 built in preamps? If I was to turn the gain all the way down on the MFJ unit, would it still be useful as a preselector?

2) Does the twin PBT suffice to help copy CW in heavy QRM or is the optional 500hz filter a "must have" for this type of listening?

3) I notice most R75 owners employ the ECSS (hope I used the right initials) method of tuning AM broadcasts. Is this because there is no AM Synchronous detector (I thought it had one) installed on this radio, or does it come with one that performs poorly?

Thank you all for any help/suggestions you might offer.

Steve

Steve,
I can answer item #2 for sure; you need the filter, I also have one I would sell if interested.
Yes the SAM performs poorly on the R75; there are aftermarket mods I believe.

From: danbar_54
Topic: 928 Message: 928

I will be purchasing an IC-R75 and would like begin DX'ing, not casual listening. I can only install an external antenna in my attic which is about 30' long. I was wondering if I could use a high performance antenna like the DX-Ultra, and simply form a "U" by attaching the anttena to the rafters, instead of stretching it out end to end? This antenna should be able to support the full frequency bands of this receiver (0 to 60mhz)...An antenna tuner would not be out of the question. My only other SW radio is a Zenith Royal Transoceanic 3000-1.
Thanks,
Dan

929. Radio Master

Hello,

I am new to the shortwave scene, but am interested in getting involved. Maybe just listening at first. I have looked and found that the R75 seems to be a good starter reciever someone just getting started? I don't mind paying a little extra to get a GOOD unit. Is this a good unit to get to start listening in on the world and maybe doing some DXing?

Any help is appreciated!

Thanks,

Rp

hi Steve:

congratulations on the R-75. i bought one a month ago and love it.

1) you probably will not need the MFJ preamp/selector, which is good news because i have something similar and turning those knobs is a pain in the butt anyway. that being said you could still use it as a preselector or use it for some gain even though the R-75 has plenty of gain available.

2) the twin PBT with dual 2.4 kHz filters can 'get down' to about 1.1 kHz bandwidth... yes you can copy CW but not in heavy QRM. you can plug the output of your speaker into your computer's soundcard and probably get software that will cut out certain parts of the spectrum also... i even have a program that will translate CW... works pretty well (i do not know CW)... and it works just fine with the 2.4 kHz filters, matter of a fact the wider the filter the better since it destinguish between the CW sources and wider just means you 'see' more at once on the scope.

3) i use the 6.0 kHz filter for AM but i do sometimes use ECSS. the reason being is that the R-75 is very stable /and/ this method helps with fading and interference on one side. the sych detector does not work however kiwa (www.kiwa.com) will fix it for $45 if it bothers you. when i get a wider ECSS filter i suspect i'll be using it over the 6.0 kHz AM filter.

phil :)

Rp:

the R-75 is a great receiver. yes there are more expensive ones but it is quite sensitive and quite selective with the dual 2.4 kHz filters. with two preamps you'll be able to do some great dxing. the unit is small, well constructed, and has a sharp display. you won't be disappointed. don't let the price fool you... for $510 right now at KJI it includes the audio DSP free! that can't be beat! other units you could look into are the Drake R8B, AOR 7030+, and the NRD-545. IMO they are not worth 2-4 times the cost of the R-75... the first two don't even have an audio DSP cuts down all the noise and makes listening more enjoyable. the R-75 is a very good dxing rig.

phil :)

934. CR-282 filter

Has anyone installed the CR-282 filter in the R75? The instructions in the user's manual appear sparse. Does the filter really improve the R75?

Thanks,

David

Thanks for the reply. After talking to my Dad, he thinks the same thing, OLD ham guy from long ago. I guess I might just go with this one, KJI seems like the best price.

Now to antenna's, I live in neighborhood that will not allow the big antenna, so I need a attic one... Any suggestions?

THanks,

936. Question?

Yahoo group: icomr75 (2000 — 2002)
Date: 2001-12-29 18:05:16 UTC
From: lucifigus
Topic: 936 Message: 936

I am deciding to upgrade from my medicre portable radio for SW listening. I am considering the R75, but I am unclear on a couple points. I am not completely competent with all the terminology, so please bare with me.

The R75 is listed as having no syncronous selectable sideband. Just what does this mean as a limitation of the receiver? Does this mean it will not track a signal on sideband?

Are there any necessary add on options to significantly improve this receiver?

Thanks,

Gary Weber

howdy!

i think you will be pleased with the R-75. i bought mine at KJI. it's a mom and pop type shop done right and very well stocked with ICOM. the guy who owns it, Gene, is who you'll talk to... he's a ham and electrical engineer who's been in the business ~20 years.

> Now to antenna's, I live in neighborhood that will not allow the big
> antenna, so I need a attic one... Any suggestions?

i live in a condo... believe it or not i put up '50 foot of wire wrap wire (white, $5 at Radio Shack) and it is doing /quite/ well attached near my ceiling. you can do the same in your attic... put up 50 or 100 feet of wire and keep it away from anything that has current running through it (fans etc). it's easy, cheap, and works well! people often buy some $100 amplified antenna that promises the moon and stars all to find out that it's just junk because a $10 piece of wire works better.

> THanks,

no problemo!

Gary:

you'll be /very/ pleasantly surprised moving up from a portable.

> The R75 is listed as having no syncronous selectable sideband.

actually it has a synch but it doesn't work :o.

> Just what does this mean as a limitation of the receiver?

synch can be though of as automatic ECSS. what is ECSS? ECSS is basically tuning in AM stations in as side bands (USB or LSB). why do it? it reduces fading and since you're only on one side you can often avoid an offending signal (noise) on the other side. no synch means you must do this 'by hand'... is this hard? according to to Passport it is 'painstaking' but in reality all you do is press a button (SSB) and possibly press it again to switch between USB <-> LSB. not real painstaking.

> Does this mean it will not track a signal on sideband?

the R-75 is very stable.

> Are there any necessary add on options to significantly improve
> this receiver?

honestly the receiver is quite good 'as-is'. i am creating an R-75 site that will have tips on it. if you want to fix the synch detector kiwa will do it for $45 US. if you want to swap one of the fixed (soldered in) AM filters kiwa does that for $90 US. my recommendation is get the unit without the optional filters (or anything else extra) until you figure out what you'll be using it for... and i do not say this to be 'flip'. i have been in this hobby several years with a portable and i bought the R-75 for dxing but what i have found is that the DSP works so well i keep it on all the time listening to hams or talk radio while i surf online.

phil :)

I would do one of two things:

1) String up the longest dipole you can in your attic

or

2) String up the largest 'loop' you can in your attic

A loop would probably be the better choice, and would be easy to make. All you would need is some nice stranded, bare (not jacketed) copper wire, a center insulator (a peice of wood, plastic, etc) and a hunk of coaxial cable and a PL-259 connector.

The wire could be obtained at Home Depot. There's some great deals on wire there! I bought some a 500' spool of #18 guage stranded bare copper wire for about $14. Easy to work with and solder and of very good quality. I have made quite a few antennas with this spool of wire, and have plenty left over.

The rest of the stuff (coax and a connector) could be had at Radio Shack. A loop antenna tends to be low-noise, broadbanded, and only slightly directional. These are all good things for your application.

I'd suggest you buy either the ARRL Handbook or the ARRL Antenna Book, both of which describe how to build a loop (among plenty of other antenna designs) as well as how to select and work with coaxial cable, connectors, insulators, etc. It is good to have a reliable point of reference for antennas because they're the most important part of your listening setup. While a random length of wire works okay for strong stations, properly designed antennas will help you pull in more exotic DX.

I agree with Ron. I had the R75 for quite a while before installing the TCXO. I really hated the drift in the first half hour, without the CR-282. However, if you leave your radio on for an hour before listening/tuning, then the drift with the stock internal crystal is reduced.

945. Question re: filters and mods

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-01-02 12:36:50 UTC
From: lucifigus
Topic: 945 Message: 945

I am strongly considering a R75 as my first tabletop radio. I am not any sort of electronics widget guy, I just like listening to radio, preferably good radio - world band among others. The upgrade to a tabletop such as the R75 brings about many features and possibilities which I have never encountered before.

There seems to be a disproportionate increase in the performance of the R75 with a few, reatively inexpensive upgrades. What I am having difficulty with is trying to decide what the differences in the choice of upgrades really is.

Is there a general sense of a list of priorized mods to the R75? If you are going to spend $200 on upgrades, what should be done first? If one is to add filters, is one more significant than others? Do these choices depend on what and how one listens to their particular radio?

I am almost sold on Kiwa mods (If I want high fidelity FM, I will turn on my stereo). Is there any reason I should look at something else?

What is the performance difference with the CR-282 installed?

Sorry for the questions, but I don't seem to be able to find a decent book that explains all this without becoming a technician.

Gary Weber

I think add-ons are just a case of personal taste. This is my preferences:

I would never buy the x-tal ove CR 282. The drift from turn on is less than 20 Hz. When warm the R75 is rockstable.

The DSP ANF/NR is a good one. I like the ANF the best. However it is not a must! The noise reduction is just a few dBs. It sounds much more because when you hit this button the audio is down abot 7 dB!

The extra filters are good, especially the 455 kHz versions. I listen to all stations in the SSB mode. If I had to choose one filter the 455 2,8 would be my choice. (I bought the 2,8 + 3,3 kHz two years ago and I do not use the 3,3 kHz any more.)

> What is the performance difference with the CR-282 installed?

For listening to broadcast stations on shortwave, the R75 is fine "out of the box". Do not buy the CR-282.

The CR-282 is mainly used by people interested in FSK-type digital modes (frequency shift-keyed) that are extremely narrow in bandwidth and hence ultra-high stability is required. Perhaps some CW (morse code) fans might also be interested. But for shortwave broadcasts using AM, the CR-282 is completely unnecessary. Having owned several Icom HF radios I have never found the need for the high-stability option. These radios are rock stable to begin with.

The only option I would consider would be the UT-106 DSP unit, which right now you don't even need to buy separately because Icom is including it free with the purchase of an R75 (offer expires 03/31/02, info is from Universal Radio's website but the same deal should be available at any Icom dealer). Seeing as you'll be getting the UT-106 for free if you get in on this deal, you'll have everything you need (in my opinion). If you get into utility listening on SSB you might want to buy an SSB filter someday, but the UT-106's ANF (automatic notch filter) is probably all you'll ever need anyways.

Once you buy your R75, you'll have everything you need from a receiver standpoint; the next thing to consider is an effective antenna system. Antennas can make all the difference. An efficient antenna hooked up to a $150 Radio Shack portable can blow away an R75 attached to a random hunk of wire. Keep this in mind. Roll the money you would spend on accessories for the R75 into an ARRL Antenna Book, some wire from Home Depot and a soldering gun. Or, solicit the advise of people who have purchased ready-made antennas. I build all my own antennas so I can't offer any specific recommendations for store-bought ones, but I'm sure plenty of folks on the list could.

The R75 is a great unit, you'll hear plenty of interesting things on it.

How severe is the drift? 10 Hz in 30 minutes? 100 Hz? I don't have an R75; I have an Icom 746 which I use for shortwave listening. The receiver section of the 746 should be practically identical to the R75 (the accessories are the same, including the TCXO). I don't have the CR-282 and have never noticed even the slightest bit of drifting. This includes turning the radio on and immediately beginning PSK31 copy on the ham bands (where any drift would definitely be noticed).

Nonetheless, for someone who admittadly will only be listening to AM broadcasts on SW, the $115 cost of the CR-282 is better spent on antenna-related things.

Hi Gary and group,
I have a R75 for sale, see below for the add. It has a lot of adds as you can see. I will sell it for $700.00 including shipping in US. That is a whole lot of savings for this receiver with this many options especially the ones that are most popular. If you like to record your findings then you will enjoy the UT-102 Voice Syn; you can start the recorder and press on the voice unit and it will announce the freq, time, mode etc. so when you play back your recorder you will have like a date/time/freq etc. stamp so you will know when you recorded and so on.
Email me for any further questions.

Excellent condition! Have everything as new, box, manuals etc. I also have installed the following: UT-106 DSP Unit; UT-102 Voice Synthesizer Unit; CR-282 High-Stability Crystal Unit, plus the following filters: FL-223 1.9kHz for SSB and FL-52A 500Hz for CW/RTTY.
This unit is Loaded! Over $1,000 invested, asking $700.00 including shipping in US. (A new unit with FREE DSP is still $600.00 plus you will wait for a while for the DSP unit from Icom, then you have to install it, if you know how, so for $100 more you get over $550.00 worth of options.

Thanks for the information. I really think I am sold on the R75 as it will elevate me to a new level of performance with a rather interesting learning curve. I have been playing with antennas lately and I have Joe Carr's books coming any day. I am currently using a clothesline (10 mters long) and an folded longwire (about 25 meters long)hanging off the clothesline. I have it run to a balun which splits to a ground and a coax feed into my flat. I will have to run more coax into the flat so I can move the radio from the den into the bedroom.

I am not an expert on antennas, nor will I claim to be. However, what I've read is that the dielectric properties of the poly materials usually used to jacket stranded wire can result in at least some very small attenuation of signal. *shrug* in reality it's probably so small as to not concern most people.. may even be a myth, forgot where i read it.. I'll let a true antenna guru chime in if he or she likes..

In tests with Beverages, EWEs and long wire antennas, insulation or lack of it made no difference in signal strength (As measured on
WJ8712P and WJ8711A meters).. Nor did solid vs stranded wire make a difference in signal strength. (although stranded seemed to last
longer)
BUT --- if you are going to put out temporary beverage antennas, you may wish to opt for the more expensive teflon coating --- there
is a world of difference in reeling in 1000 to 1500 feet of wire (AWG 22 to 26) with teflon vs the standard coating vs no
coating....it does not snag in the trees nor undergrowth.

I don't recall exactly anymore, but the drift was enough to
require retuning in SSB modes -- it was quite annoying when scanning a
frequency range hunting for signals, since they weren't at the top of
the KHz.

Many Icom radios can use the CR-282, the UT106 and the UT102.
However, I don't think that's enough reason to assume the
receiver sections of these various radios are identical.

It appears that the free DSP cupon is available ONLY to residents of
the USA. Is this correct?

> What's wrong with jacketed antenna wiring?

Right now in my neck of the woods it would
allow more "Ice" to build up on the thicker
diameter conductor and provide more wind
loading too.

I used 12 Ga solid copper house wiring with
the insulation removed. It's been up between
two trees for the last 8 years. The garden variety
rope to suspend it from my local K-mart lasted
two years max then the antenna wire fell. Then
I got some very high quality black rope from a
Hamfest (may be military grade..I am not sure)
and it's lasted 8 years and still going strong.

Sorry, but I can't give you a source for this rope
but it should be available from any Amateur Radio
antenna supplier. I believe it is highly resistant
to UV which allows it to withstand the elements
better.

Could be polyester - that material is very UV
resistant.

I've used the 21 g steel wire from the hardware store with good results. Comes in 100' rolls for about $5.

That's what it says on Icom America's website. However, when they offered the same deal back in 1999, Icom America cheerfully sent me the free DSP to my Canadian address. Back then, I had checked with Icom America before purchasing and they said that as long as I purchased the radio from an American dealer, that they would honour the coupon for the free DSP. So, if this interests you, then you may want to contact Icom America. Also, don't bother waiting for Icom Canada to make the same deal -- it won't happen.

Hi folks -

I bought an R75 last week and shipped it off to KIWA for his mods. I'm a bit confused about the filter system though. A reviewer on Eham mentioned putting the 3.3 filter on the 455 board and FL-223 1.9kHz on the 9Mhz board. I had the impression that the filters were cascaded - meaning, to me, that the signal travels thru th 9 board filter first and then the 455 board. This would suggest that you use an equal or small width filter on the 455 board.

The fellow that did the review creates the impression that the 2 board s work independently and do not cascade. Can someone clear this up?

Also, the 455 board filters are amazingly expensive. I normally use Inrads and am only familiar with HAM radios by TenTec and Elecraft. Are the ICOM filters any good and why are they so pricey?

Any help would be most appreciated. 73/Tim Logan KB7OEX

Crystal filters for 455 kHz are very pricey. In Sweden the price of the INRAD and ICOM filters are about the same. (Around 160$)
THe 9 MHz filters are a little less expensive. ICOM 60US$ and INRAD 95@ I think.

You are correct about the different filters sections. The are cascaded, but you can select filters independently. If you buy the 1,9 + 3,3 kHz you have the following alternatives:

9 MHz : Bypass, 2,4 and 1,9 kHz

455/450 kHz: 2,4 + 3,3 + 6 + 15 kHz

You can have 3 different combiations. I would recommend you this for SSB and ECSS reception:

Narrow: 1,9 + 2,4
Normal 2,4 + 3,3
Wide Bypass (=15 kHz) + 3,3 kHz

For AM

Narrow 1,9 + 2,4
Normal15 + 3,3
Wide 15 + 6 kHz

AM-S (´No 455 kHz filters available so no really good combinations)

Narrow 2,4 + 6 kHz
Normal 15 + 6 kHz
Wide 15 + 15

I totally agree with you. I use the ANF a lot as it actually
works! The NR are of limited use as it also adds a more robotic
type of character to the speech, so it will be harder to try
and listen to weak signals. With semi-weak signals it works ok
as the speech quality is good to begin with and there is not
that much noise left to reduce.

Do you know if there is schematics available on the net for
the UT106 or R75 so one could locate a resistor to change
to get rid of the annoying audio drop?

Ubbe.

Thank you for the pointer. I noticed that the same problem
with reduced audio level exists with other Icom equippment
that use the UT-106. Must be the audio out from the UT-106
that is too low.

The R75 schematics shows that is just a simple cut of a
trace, or lift a capacitor, and adding a jumper so that
the audio goes thru the pin of the voice synth UT-102.
Then there is a pot that can be adjusted for the audio
level comming from the UT-106.

I probably have to back-trace the UT-106 to be able to
do any mods to it, instead of just compensating for the
problem in the R75.

I have not yet received the dsp unit from ICOM (sent the coupon in a week ago), what audio drop have you experienced? Also, I'm no tech person but if the drop relates to the UT106 itself and any of you are smart enough to locate the cause and suggest a mod - well, I'd live to know what the mod is! Thanks and have a good week folks! 73/KB7OEX Tim Logan Gilbert, AZ

I can't modify the R75 because the ANF mode doesn't drop the audio.
So I have to find a schematic of the UT-106 to help me a bit on
the way.

You can take your chances and get a used one. I got mine from a ham web site classified with the DSP in the original box with manual in excellent condition for $500. That seems to be close to the going price for a used one. Ham sites tend to make me a little less nervous than a place like ebay, but my suceess rate with ebay has been good also.

Check with KJI Electronics at 973-239-4389 (NJ). I just bought one for
509.95 .
I'm not affiliated with them in any way (except as a satisfied customer).

Good Luck
Clifton

From: proverbs_uk
Topic: 979 Message: 979

HI there just joined the group and I must say plenty off info.

I live in the Northern Ireland (UK) and was Thinking of buying a new radio ICOM R75E, IcomPCR1000 or Yaesu FRG100, the R75E did catch my eye the most. My second choice would have been the FRG100, will the R75 out prefrom the FRG100.

I was going to buy the FRG100+FM with free PSU and a Wellbrook ALA1300 loop anttenna the price came to about £560GBP. But would I be
better of buying the R75 at nearly the same price £579 without the ALA1530

I was going to order the R75 from Waters & Stanton PLC in England the price they are quoting was £579 with PSU plus £3.00 P+P. Is
this cheap and has anyone ever brought from this company in the pass.

What ever radio I get, it will most certainly out preform my Radio Shack DX-349 GCR.

good day to all and "Happy New Year"

You very wisely mention your concern for a good antenna....if those
two scenarios are your options for some time i would go for the FRG100
and the Wellbrook. Great combo I think....as are the R75 and the
Wellbrook...

This antenna is absolutely superb and you will have to remember that
your reciever in general is no better than your antenna

Hope whatever you choose will make you happy about your radio.

Go for the R75. You don't need the ALA 1530 right now, just take some wire and make a very nice antenna expending no more than £15 pounds.
Sure, the FRG100 is a very good receiver indeed and has the name yaesu that speaks for itself. If you thing just about casual AM/SSB reception, the FRG100 would be more than adequate, but if you want to go a bit further you must get the R75. I've got both radios here so I can say that the icom is a better deal if you are looking for dx reception. The yaesu does not have the dual passband, noise reduction dsp, dual RF pre amp and keypad, quite helpful features. Also, the R75's menu is a plus comparing to the FRG100. Final, you don't need an optional computer interface to plug the R75 in you PC.
One thing that I would like to see on the R75 is the analog s-meter that comes in the yaesu. The R75 s-meter is not very acurate.
Hope I have helped some way.
Happy New Year,

Andre Santos

Subject: [icomr75] R75 or FRG100

HI there just joined the group and I must say plenty off info.

I live in the Northern Ireland (UK) and was Thinking of buying a new radio the ICOM R75E, ICOM PCR100, Yaesu FRG100, the R75E did catch my eye the most. My second choice would have been the FRG100 will the R75 out prefrom the FRG100.

My delema did I was going to buy the FRG100+FM with free PSU and a Wellbrook ALA1300 loop anttenna the price came to about £560GBP. Would I be better of buying the R75 at nearly the same price £579 without the ALA1530

I was going to order the R75 from Waters & Stanton PLC in England the price they are quoting was £579 with PSU plus £3.00 P+P. Is this cheap and has anyone ever brought from this company in the pass.

What ever radio I get, it will most certainly out preform my Radio Shack DX-349 GCR.

good day to all and "Happy New Year"

>

As someone else stated, if you can, a random wire will do fine
as an antenna. I understand the Wellbrook is an excellent
antenna, but passive beats active generally.

I have an R-75 and used to own a FRG 100. They are close in
performance but have different sets of favorable characteristics.
What it comes down to is what you will be doing:

Pro R-75:
o Currently in production
o Direct keypad frequency entry
o DSP option along with filter options
o Includes FM mode and coverage to 60 MHz (at least in US)
o Tunes down to 1 Hz increments in CW/SSB.

Anti R-75:
o Sync AM useless without modifying the radio
o AM sounds harsh
o Carrying handle an option.

Pro FRG 100:
o Nice sounding AM and SSB audio
o Filter options available

Anti FRG 100:
o "Chuffs" when tuned rapidly
o No direct frequency entry (But still easy to move around bands)
o No DSP option
o No Sync AM; FM an option
o Out of production
o Battery maintains memories (ICOM battery only runs clock)
o Oddball power connector on back should you want to run from 12 VDC.
(Use ICOM CP-13 Cig Ltr adapter, designed for HTs. Has right plug.)

Everything else, IMHO, is a wash. Both are excellent "low end" desktop
receivers, very sensitive, very useable. Both are quite stable but
do drift a bit; both have TXCO options, "fixes" and mods from KIWA
and over the net. Both are built well mechanically.

If you do mostly program listening, consider the FRG. If you do
a lot of ute listening, go directly to the ICOM. IMHO.

Eric

983. 100 vs 75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-01-10 06:25:44 UTC
From: philberttroy
Topic: 983 Message: 983

I have both of these radios and in my humble yet loveable opinion I must beg to differ with the previous posters. The 100 is clearly a step down from the 75. In fact, my 75 out does a highly modified jrc 535d that I have here in the shack. I would definately not consider the jrc "low end" and the 75 is superior in terms of overall sensitivity and useable features. My 75 has all the KIWA modifications and I am glad that I had them done. Filter selection now makes sense and the sync. works a bit better on selective fading conditions. The audio is better now.
The 75 is the best radio I have, out of over 20.
The more I use it the more I want to use it. It is a perfect marriage of ergonomics and functional features. Light and effervesant like morning dew on a downy leaf..........hahahaha.
I realize this radio is no wadkins or 340 but it is not a 3600 dollar radio either.
Good luck in your choices and believe me get ready to have some fun.

hello!

get an R75! you will LOVE it compared to a portable. the FRG100 is not a bad radio but the R75 is better. the FRG has been discontinued, has a small screen, and has no keypad. the R75 has a great DSP for noise reduction, has twin-PBT, is very well built, has a very sharp and bright display. as far as the antenna goes all you need is a random wire one... hook 50' of wire into the terminal in the back and put it up as high as you can.

phil :)

985. Ref: R75 or FRG100

Thankyou all For replying to my Question, it has Greatly Help me in choosing a radio,
did'nt expect such a big response, you all seen to have great Group keep it up,

The R75E looks like a Excellent radio also meets my needs.

At the moment i am using A random wire and old Antron 99'CB anttenna with a Global AT-2000 ATU. So I will probally take everyones advice and Skip the Wellbrook ALA1350 and buy it at a later stage.

Thanks again. God bless!

I also have both receivers and believe that the R-75 is about twice the receiver the FRG-100 is. Since I got the Yaesu for about half of what I paid for the R-75, I think it is a pretty good value, but if you can possibly afford the price difference, definitely go with the Icom.

Along with the other excellent opinions and observations, I must also add that if you do indeed get a FRG-100, make sure you have a way of ATTENUAING the signal before it gets into your radio. In Europe, I believe that you are not going to have to worry at all about sensitivity, but selectivity and overload. The FRG-100 is a hot receiver and as Radio Netherland's review states "perhaps too hot". I live on the "quiet" west coast of the US and most signals on the FRG-100 some in at S9+. The FRG-100 actually does not overload, which would cause desensitivity on nearby weaker signals, but the AGC kicks in very strongly and has a much faster attack time than decay time. What that means is that while you are "channel surfing", if you tune past a very strong signal, you will likely miss a weak signal nearby unless you tune very slowly and wait for the S-meter to settle down after passing the strong signal. This is also very apparent when pops and crackles come in. Fortunately, the noise blanker works very good at removing noise that comes from electrical switches and relays (as does the R-75).

A nice thing about the FRG-100 is that the antenna selection between a long wire and SO-239 connection is a hardware switch. That means you don't have to reprogram memories if you change antenna systems. The bad thing is you have to reach in back of the radio to switch antenna inputs if you have more than one antenna source and cannot do it with a push of a front button as on the R-75.

I made an attenuator out of a rotary 100K logarithmic potentiometer and it works nicely at taming strong signals. Much of the time, I also have both the 6dB and 12dB attenuators turned "on" while using the FRG-100.

In terms of direct input tuning, I don't find the lack of it on the FRG-100 to be much of a hindrance at all. With the user selectable "fast" rate and the band switching mode of the up/down keys, I can get around the HF spectrum as quickly as needed. The memory mode lets you select a memory then tune away from it without having to go into VFO mode. When you switch to CW mode, the radio automatically tunes to 600 Hz away from your current location. It also lets you hear AM or SSB modes through the CW filter which allows for another bandwidth setting. There are a lot of user definable settings on the FRG-100 that make it fun to tinker with like beep

volume/frequency, tuner adjustment/alignment from the front panel (so USB and LSB are placed wherever you like). Lots to tinker with, lots to get you into trouble, but all reversible with a system reset.

The place where the R-75 really surpasses the FRG-100 is at non-SWBC listening. This includes, amateur radio and global aircraft transmissions on SSB. In crowded ham situations, the twin passband filtering easily knocks out nearby "monkey chatter" much better than some receivers that only have IF shift and is more flexible than a fixed narrow band filter. If a nearby carrier is causing a "whistling" on the conversation, just push the ANF and it goes away (DSP required). The DSP noise reduction works pretty good, but on SSB signals, I often prefer to use the variable RF gain control to cut down the signal until the noise goes away, then turn the volume back up. I also like the fact that you can computer control the R-75 with a straight through serial cable and not have to buy/make a special voltage converter cable to talk to it.

In terms of sound, the R-75 is optimized for voice communications (it is built on the same chassis as the Icom 718 transceiver) and sounds a little harsh on SWBC. The Yaesu has an annoying top firing speaker and sounds muffled. However, both receivers sound great with an external speaker. I use the RCA Pro-X33A speaker from Radio Shack. On SWBC, it brings back the rich sounds reminiscent of the FRG-7700 and still sounds good with ham signals. Best of all, it is only $20 when it goes on sale about every other month.

I didn't get a Yaesu power supply when I got the FRG-100, and was dismayed when I discovered the odd power plug. I found an electronic surplus store that had the right plugs and power supplies at a good price. If anyone needs one, look for the power supply or plug that fits the Media Vision Reno CD-ROM player. It supplies 1.5A. I got the P/S for $5-$10 (I don't recall).

Bottom line: The FRG-100 is a competent tabletop receiver at a very good price, especially used. However, if you can possibly afford the price difference, go for the R-75, you will not regret it.

Good luck and 73,
Roy

I agree with all of the following, but note...the
little RCA-Radio Shack speaker mentioned (Pro-X33A),
while it does sound very good on this radio, has gone
bad on me quickly (2 months) and I cannot open it up
to see what, if anything, is rattling and introducing
distortion. It is rated for 15 watts, and has never
had any more pumped through it than the 1.5 W max
output from the R75. Be sure to save the receipt.

Is that 15 Watts continuous pink noise or 15 Watts peak? If it's 15 peak, figure 3.5 RMS. A 1.5 W source, clipping moderately, can smoke it.

you should feed amp-type speakers setups with the output that comes out of the back 'ext speaker' jack... it is more like a 'line out' jack. feeding an amp 1.5 watts is too much.

phil

It probably means 15W peak (I didn't see any basis,
either peak or RMS); but the R75 simply doesn't get
that loud, and I never played it that loud. In fact,
there have been many times when I could NOT turn up
the volume loud enough to get enough sound, and my
hearing's fine.

Honestly, I think the speaker is designed to manage
more than 3.5 W continuous or RMS.

The problem is that many people don't realise that one of
the easiest ways to blow a speaker is to UNDERpower it.
If the amp on the radio is driven to clipping, at best it
will put out square waves, with all that energy in the
harmonics. Problem is, the voice coil simply cannot move
that fast, so the energy is dissipated as heat.

Good, high end audio amps deal with this problem well, but
I think everyone appreciates that the money in these receivers
isn't spent on the audio amp.

I like Barjan speakers (made for 2-way radios, 3.5 mm plug fitted, crinkle finish matches R75). They are available at CB shops, truck-stops, etc.

I have come to expect that anything from Radio Shack is less than it seems.

Hello - So what type of speaker, then, would be ideal
for the R75? Rated power and type? The R75 begs for
an external speaker, and if I don't have to pay the
exorbitant price that the radio companies charge for
their speakers, I'm interested...

Thanks,
Bruce Jensen

I use headphones. :-)

Actually, any *sensitive* speaker at 8 ohms would do fine,
but if it is a current design made for a car, it's a bad
choice -- these speakers have very small magnets and requre
enormous amounts of power to get anything out of them. (You
didn't think that those 200 Watt stereos were all that much
louder than the 4 Watt ones that fed speakers with 10 pound
magnets, did you?)

Sensitivity is measured in SPL (sound pressure level). The
higher the better. If you need to *really* crank up the volume
for a normal listening level, it's a bad choice. Keep that in
mind when concentrating on finding that weak signal in the
noise... if it sounds like the speaker or the amp is distorting,
back off FAST. You can destroy the voice coil instantly and
specacularly.

(As an aside, an audio engineer wrote a column for net.audio,
a newsgroup on usenet prior to the Great Renaming... one of
his stories was about teaching a lesson to sales-weenies that
were passing off a high-end set of speakers as indestructible,
and he used a 20 Watt/ch Pioneer amp and a turntable, and skittered
the needle across an LP (with volume at full) and was rewarded
with blue flashes and smoke from the tweeters of the speakers.
Anyone else remember "The Audio Anecdote of the [interval]?")

You probably can do okay with the R/S speakers, if they are
sensitive enough and handled well enough. You might consider
buying just a full-range driver and building your own case.

For my radios that I use external speakers on, I use passive
Yamaha PC speakers I got at a hamfest for $5. I can use one
of those if I really need it.

From: Jean Jacquemin
Topic: 928 Message: 1001

Sorry for this late answer...
Have a look at :
http://www.wellbrook.uk.com

The ALA 1530 and ALA 100 make wonders in limited space and apartments. I've been using them both for NDB Dxing and found them to overperform a 150' long wire outdoors .
You may well install a ALA 100 in your attic , with two, or
more crossed loops . It's a very sensible and quiet antenna
especially below 25 Mhz.
You may e-mail me for more information.

Subject: [icomr75] Antenna for limited spaces

I will be purchasing an IC-R75 and would like begin DX'ing, not
casual listening. I can only install an external antenna in my attic
which is about 30' long. I was wondering if I could use a high
performance antenna like the DX-Ultra, and simply form a "U" by
attaching the anttena to the rafters, instead of stretching it out
end to end? This antenna should be able to support the full frequency
bands of this receiver (0 to 60mhz)...An antenna tuner would not be
out of the question. My only other SW radio is a Zenith Royal
Transoceanic 3000-1.
Thanks,
Dan

I like this thread a lot!
I am interested in recommendations for both speakers and phones.

I find some Hi-fi style phones and speakers sound either too BOOMY -great for rock mx but makes the audio wierd- or very toppy which brings out the static.

so any recommends for ones suited to our needs?

I third it, just got mine (Gene says it's going to 520 or 529) for 509 and he even wrote me instructions on how to build an antenna in my attic. Just finished with it today and it seems to work! All I need to do now it get the long wire antenna out.

So what is the difference and what ranges do both antenna's work, what bands does the long wire do better for?

Also is there a poster one could get that shows band and associated freq's, and other things? (I a newbie)

Thanks!

Sorry to reply to a reply but I couldn't find the original post.

A good source of high-quality antenna wire CHEAP is to go thru the yellow pages and find people who repair/rebuild/rewind electric motors.

They buy enamelled wire on huge spools, and often have leftovers that are plenty long for antennas but not long enough to do another motor. I found two places in my town. One was a big place, too much bureaucracy to sell me wire. The other was a "mom and pop" shop. Sold me 3 remnants--#18, #19 (yes they carry weird gauges), and #20 for $5 all told. He was glad to get it off the shelf.

And don't ignore plastic electric-fence insulators for about $2 a dozen at Home Depot...

The #18 wire is hanging between a tree and my roof right now in the form of a 100 foot random wire. I still have more left on the roll. The other two spools I might use for a broomstick or to wind chokes or something. Although I was eyeing a couple of other trees and might just build a delta loop. The R-75 DOES have 2 antenna inputs after all...

1005. ANTENNA EXPERIMENT ,

ANTENNA EXPERIMENT

ON Saturday 12-1`and Sunday 13-1 I have made a temporary experimental dipole antenna with active elements of 12 m and 16 m. Wire used is 0.5m single copper wire

Receiver connection [say here twin wire] cable was a twin , stranded copper wire , of 0.15 mm each wire, length is about 6 m.

Dipole has been constructed having the same lengths for both parts however due to constraints of the garden a small part of the antenna has been folded
As the system is only temporary , I have supported this antenna into natural supports. Left part (the 16 m is suppored by another wire of same type , about 3 m and this over two antenna TV cables in order to be a little high.(abt 3 m from the ground) This connected to the balckpart of the twin wire
The other part is supported by 3 tress on nearly the same height but about 3.5 m of length has been wound due to constraints of the garden.This connected to the red part of the twin wire
This is the first experiment . Later this year i intend to install a multiband inverted V (5 dipoles connected tp a main) over the roof for a maximum length of 20 m per pole (fixed installation)
Two series of tests have been made :
Comparative dipole cs 16 m wire testing
Same testing but MFJ antenna tuner 16010 has been used
Results as opinion form:
Mysteriously when reversing the ☐poles' on the radio R75 ☐ is like using two diferent antennas , even when using the antenna tuner. Different signal levels and different noise levels and sometimes directivity It seems that ground does not play its role correctly (?)
Possbly due to very thin wire , most signal levels are lower than single wire antenna. I am correct? If thiis is true this diference can be 6 db lower dur to surface only.
At several bands though signal levels are lower than single wire antenna in most cases have lower noise levels . As in example 7120 IRRS at 0915 shown levels below S1 unit - still with the antenna tuner - but was noise free . IN contrast to it the single wire antenna shown levels of S3 full of noise (no signal was audible)
IN another example R cochiguaz 2120 on Sat 13 was audble (still as marginal) only with the dipole
Dipole has enhanced reception in my most un-useful bands: LRA Argentina feeeder at 29810 has 3 S units higher level than single wire More particularly: 29-25 , 14-13, 11-10 , 4-3, 1.6 Mhz shown enhanced reception
IN the highest bands both a capacitance and inductance are required to tune the dipole . IN the lower bands (from abt 7 Mhz and lower) only inductance is

required . On 9 MHz different antenna tunings are required between the single wire and dipole
Here are the measurements:
Legend:
AB black red (connected to input / ground correspondingly)
BA red black
Red: pole from the tree side
Black: the free to air wire
IN all these cases cables are connected to the 300 Ohm input
Measurements without antenna tuner

Hi Jean

Having an 1530 myself I have been contemplating getting a ALA100 (because those Wellbrook antenna's simply kick's a..) too.. you say you have mounted it in your attick ? How low noise is it ? i would have thougth that you would get <some> QRM...I have lots of space on my property but am limited in my ability to run feedlines to the house.

how did you "mount" it in the Attic ?...

kind regards

Stephan

1007. Utility Station Question

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-01-15 13:59:50 UTC
From: kb7oex
Topic: 1007 Message: 1007

Hi folks - I'm a cw HAM who is new to SWL. My R75 should arrive back from KIWA today or tomorrow and I will pop in a 1.8 INRAD filter on the 455 board and a 2.8 ICOM filter on thw 9 board. I think the resulting combination will be good for AM and utility listening. I will cw to my HF rigs.

But there's some confusion. It's become obvious to me that all of you SWL listeners are aware of a whole world of listening that HAMS don't hear on their HF bands.

In particular I am curious about utility stations. I just subscribed to Monitoring Times and have been scanning the lists of Utilities. I'm amazed. For example, I see listed a US Military refueling plane transmission. I would have assumed that all military communications are trunked extremely rapidly (digitally?) or at a minimum in some code form.

What exactly are people hearing on these utility staions - actual intelligible voice communications? snipits of trunked systems; encrypted messages? Is there a book available that can describe to me exactly what one might hear from these various types of stations?

Obviously this is something totally new to me - but very fascinating. Any help would be most appreciated!

There are plenty of "in-the-clear" military communications on HF. Everything from motel reservations to hydraulic failures to VIPs ordering a tee-off time.

I have local AFBs on my UHF scanner, ATC San Francisco and GHFS on shortwaves. Sometimes I'll hear the same mission on all three, over a period of hours.

Hello Tim,
I came from the other side. SWL was my hobby until this spring when I decided to get my ticket and work both sides of the conversation. You can hear a LOT of traffic on HF with nothing more than a shortwave radio capable of SSB, with a BFO, or a continuous coverage ham transceiver. I would say the R-75 is comparable to the Icom 746 in performance, it's certainly a step above the entry level and mobile HF rigs thanks to its Twin PBF, continuoulsy adjustable RF gain and direct entry kepad.

To start, try 11175 kHz USB, that's the global USAF HF frequency. It is very busy and you can hear lots of traffic on it. Check your Monitoring Times for more frequencies and also check out the commercial airline HF list. Here in CA, I constantly hear traffic from San Francisco to planes out in the middle of the Pacific and have even heard traffic between Ireland and planes in the Atlantic. Lots of fun pulling in those DX aircraft!

Dan - I believe this is answered on the KIWA site - and yes, the warranty would be voided. I just got my rig back from KIWA and was very pleased with the results. 73/KB7OEX Tim Logan

1015. R75 observations

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-01-22 18:37:21 UTC
From: Dave Ulrick
Topic: 1015 Message: 1015

Greetings!

Now that I've had had my R75 for nearly a month, it's time for me to delurk and share some observations I've made about this fine radio. My radio is a stock American R75 with the DSP; it has no optional filters or modifications. It's connected to a 100' outdoor random wire antenna. I'm located in Belvidere, Illinois, approximately 90 miles northwest of Chicago.

First off, I've found that the stock R75 is perfectly fine for program listening given a good external speaker plus a bit of tweaking. I bought one of those RadioShack/RCA minispeakers and connected it to the R75's external speaker jack. It gives me a full, rich tone with plenty of bass. However, simply using an external speaker wasn't enough to give me good audio except on non-fading AM signals. As many have reported, the R75's AGC on AM causes audible distortion during SW fading. I've found that turning the RF gain down, usually to the first tickmark to the left of center, can reduce and often eliminate this distortion. Since most major SW broadcast stations come in very strongly, I don't miss many stations if I keep the RF gain control turned down while I tune through the SW broadcast bands.

As for the S-AM mode, I must agree that it does little, but to my ears it does do something. If I use the "set" menu to permanently enable S-AM mode, I hear an audible "howl" when approaching or leaving an AM carrier, so I can tell it's trying to do something. I notice its effect most if I keep the RF gain turned to the left one or two tickmarks. If the RF gain is in the normal 12 o'clock position, S-AM sounds no different than AM mode. Most of the benefits I hear in the AM audio quality are tied to reducing the RF gain, but I can sometimes hear a slight improvement in the steadiness of speech and music and reduction in fading when S-AM is turned on. If I switch to the narrow AM filter and use the PBT knob, I can select one of the sidebands with some reduction in audio quality. I can understand why so many folks would say that the R75's S-AM mode isn't very good, but I can attest that using it in conjuction with a judicious reduction of the RF gain knob can result in rather pleasant audio for program listening. The DSP's automatic notch filter often cuts out whistle-type noises even from AM signals, but the whistles it misses can often be eliminated by turning the PBT knob all the way to one side. Considering all these features together, the stock R75 can do a lot to make even AM signals sound alright.

Using these tricks, I find that I can listen to stations such as the BBC at 5975 kHz for long periods of time with a minimum of fatigue due to fading distortion. I have a cable running between the record out

jack on the R75 to an auxilary input on my stereo receiver. Using this method, I can get even more stable audio because I'm bypassing the R75's audio amplifier. Unfortunately, the "set" menu's beep level setting (I like a setting of 1 or 2) doesn't affect the record out audio (beep on/off _does_ affect record out; go figure), so any button presses I make on the R75 sound _very_ loud on my stereo compared to the program material. :-(

As for SSB and ECSS listening, I must join in with the crowd and agree that the R75 really shines in this department. I have sometimes been amazed by how good some hams sound: almost as though they're in the room with me. ECSS is a really nice way to pick out weaker stations from the mud in the MW and SW broadcast bands, although this method sometimes reveals that the station's carrier is not exactly located at the advertised frequency, and requires some tuning to make the audio sound natural. From my QTH ninety miles northwest of Chicago, I can often get an audible signal from WLW at 700 kHz in Cincinatti during the day if I use ECSS (WGN 720 kHz from Chicago clobbers it during the day).

When tuning the MW and SW broadcast bands, I tune the R75 in AM mode with the RF gain left one tickmark and the preamp off. This gives me good audio on most stronger stations. When tuning the utility bands, I stay in AM mode, turn on the DSP noise reduction (level 5), set the RF gain to 12 o'clock, and activate preamp 1 or 2, switching to SSB mode whenever I hear Donald Duck. :-) In the ham bands, I follow the same procedure except that I stay in LSB/USB as appropriate.

All in all, I'm very happy with my R75. Its AM audio could be better, and its S-AM mode could be a lot better, but even this side of the radio is quite nice with the RF gain control turned down a bit. If you like both DXing and program listening and have only $550 to spend, I think you may like the R75.

Dave

Dave:

nice review! i've had my R-75 about 2 months now. i would have bought it even if it only could do ECSS, aka no AM, no synch, no FM. you're right on with the utility reception... it is excellent! i too notice that the S-AM mode does sound different and works best when the gain is fiddled with.

phil :)

Dave, Phil and others -

I second the motion! That WAS a good review Dave. Nice to hear others reactions. Thanks.

I have found, like you two, that a little judicious understanding of the RF gain etc goes a long way. I tested a Drake R8B before buying the ICOM. I returned it and bought the ICOM. Oh, the price difference was pretty decent - but, frankly, the Drake doesn't "feel" like a Ham rig (I'm primarily an HF cw op). This "it feels right" sense is not objective, but still important attribute which the R75 has..

I did go ahead and have the KIWA modifications and added an Inrad 1.8 on the 450 board and an ICOM 2.8 on the 9 board. The KIWA mods made a pretty nifty difference which I thoroughly enjoy - seems to help in more areas than just the synch. However, stock out of the box I think the R75 is a really great value for the money and doesn't truly need any add-ons (except the DSP which I suspect all users have by now).

As my other rigs are not general coverage, I bought the ICOM for AM broadcast and utility listening.....which I have found to be quite a lot of fun. If I find a broadcast I want to settle down and listen to, I've always been able to smooth out fade etc etc and have a good relaxing listen! Have a good day folks

Topic: 1018 Message: 1018

Hi List

I would really appreciate any input revolving around how to "tune" the Icom R75 for NDB DXing (CW id'ing in the range of 200 to 600 Khz roughly)

I do use my NRD545 for this and at present dont see the Icom get not even close to the performance from the NRD. But...id like to make it a perfect backup reciever for this.

I have DSP-unit, 3.3 and 1.9 filters. Which other filters would i benefit from ?

Which KIWA mods would I benefit from ?

Kind regards
Stephan

Hi Eb,
I use my R75 perhaps 90% for NDB DXing--here's what I use. CW mode, nothing else selected, fast agc. I have narrow optional non-Icom 250Hz filters (INRAD) in both 9MHz and 455kHz positions. I find it makes a small improvement using both, but insertion loss is high. My volume is turned up almost all the way just to hear the signals. That's all! I believe the narrowest CW filters you can install are what's needed for effective LF NDB listening. (I've tried selecting the other noise reducing modes, but they don't help one bit, comparing them back and forth to straight CW with 250Hz filters.)
Good luck with your LF DXing!

I should also have added I almost always use Preamp 1 too.

Hi All
I would like to hear anything about the R75's performance on VLF bellow 500 KHZ.

Steve

From: Steve Ratzlaff
Topic: 1021 Message: 1022

Hi Steve,
In case you didn't get my reply to Eb; I use the R75 a lot to listen to LF NDB's (200-530kHz). I've been listening to LF since the mid-1980's. The R75 is very effective below 500kHz, at least for the NDB freqs. I have aftermarket (INRAD) 250Hz CW filters installed in both IF postions. For someone on more of a budget, just one filter in either position would also do a good job. I think the main thing is to cut out as much noise as possible by narrowing the IF bandwidth. Sometimes a good narrow audio filter between the radio output and the headphones is also useful (some LF DXers would say its essential).
I have not done any mods to improve sensitivity below the BCB. I've done sensitivity tests on my radio and with Preamp 1 enabled, I believe I have all the sensitivity I need.
Sensitivity falls off rather rapidly as you go below about 120kHz, but I've still easily copied the Japanese time station, JJY, on 40kHz (which ID's at 15 and 45 after each hour, toward the end of the minute, and sends time pip dashes the rest of the time. I'm on the West Coast, and 30 miles inland from the ocean, so the Pacific LF/VLF stuff comes in quite well here.
Steve

hi Tim:

i agree! i never had a chance to test the Drake but it looks like a huge unit and i couldn't see it being worth twice the ICOM. passport seems to belittle things like the DSP noise reduction but it really works well and should be included in a unit costing $1300 (US), as should nice buttons, and a nice display. AM broadcasts come in fine and if there is fading i just do ECSS. i've been thinking that ICOM might have a IF DSP R-75 in the works and all these great deals are happening to reduce stock... we'll see!

howdy Stephan:

i do not know CW but i know something you might find useful if the computer is nearby the radio. get 'SR5' which is a spectrum analyzer and audio filter program (link below). you simply attach the output of the R-75 (i use plug in back not audio jack) to your PC's sound card (get cable at radio shack). with SR5 you can narrow the bandwidth of the audio. you can build any filter you like by running your mouse along a two dimesional chart whose hoizontal axis is Hz and vertical axis is 'amplitude' allowed to pass. post a follow up if this program helps so others can use it. you might try turning both BPT in opposite directions to cut the bandwidth to ~1 kHz.

I'm forced to sell my MINT R75 with DSP module already installed.
The radio is just 2 months old. It comes with a FL-257 filter installed,
which is a $175 value, the UT-106 DSP module, installed, the original
box, power supply and the operators manual. The radio is a 9.75 out
of a 10, I'd call it a 10, but it has been used for a short period of time,
and yes the radio performs 100% perfectly fine.

I'm asking $585 shipping included from NJ. I prefer to sell only within
the Lower 48 states. Remember, the optional installed filter is the
FL-257, which is a 3.3Khz SSB filter, which dramatically improves
reception in ECSS mode. This filter sells new for around $175 alone!

Thanks for reading,
Gary in NJ

Gary, I am from Panama. I would like to buy your radio and you will only have to send to Miami. But you must wait a little. About two weeks.
I have a Yaesu FRG-7 in mint conditions that I am trying to sell here in Panama or Costa Rica.
Please, can you help.
I like the radio very much because of the accessories. I was planning to buy one in the future when I get the money, but I can not afford those accessories.
Thanks so much,
Carlos

Well the drag is sort of low-tech, it's a springy washer with little fingers with some fuzzy stuff on them that climb up little ramps and press against the back of the tuning knob when you move the tension control. (LOL, hard to explain in words)

Sounds like maybe the nut that holds things together might be starting to work itself loose?

The tuning knob itself is just held on by friction. It's a pretty standard D-shaped hole with a spring that presses against the flat side of the shaft. You ought to be able to pull it off carefully and look inside there then tighten the retaining nut with the right size socket or nutdriver if it's started working loose...

1034. Filters and AM audio quality

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-01-30 15:38:52 UTC
From: Dave Ulrick
Topic: 1034 Message: 1034

Greetings,

Apparently I must have too much money burning a hole in my pocket, :-) because last week I went ahead and ordered a pair of optional filters for my R75. I chose the FL-103 (2.8 kHz filter, 9 mHz IF) and the FL-257 (3.3 kHz filter, 455 kHz IF). They arrived at my doorstep yesterday afternoon. Once I figured out that the nuts and washers provided on the bottom of the FL-257 weren't necessary for the R75 and ought to be removed (instead, a mounting clip is provided in the radio to keep the filter in place), both filters plugged in with no difficulty. The manual's instructions were sufficiently clear regarding the installation of the filters and the use of the filter setup menu to enable their use.

My goal for these filters was to provide me with extra options for tuning in fading AM signals or SSB signals with decent fidelity. Although the price tag for the filters is rather high, I'm satisfied that my goal has been met.

Of the two filters, the one I really wanted was the FL-257. I'd seen several positive reports about its use in listening to AM signals via ECSS. My report is also positive. Although my time last night was insufficient for listening to any particular program for a long time, it was my impression that once I'd adjusted the tuning to zero-beat the carrier, the audio I heard via this 3.3 kHz filter was very, very close to what I hear in AM mode using the 6 kHz filter. I set it up as the SSB-W filter (with the 15 kHz/9 mHz IF filter) and the normal SSB filter (with the FL-103 2.8 kHz as the 9 mHz IF filter). (I made the two stock 2.4 kHz filters the SSB-N filter combo.) On voice program material, these two combinations are almost indistinguishable, whereas with music the SSB-W filter combo provides a bit wider frequency response. The SSB-normal filter is more flexible in that both PBT knobs may be used to adjust the apparent bandwidth, whereas with the SSB-W filter only one knob provides any significant adjustment. At first glance (hearing?), it appears that the FL-257 filter goes a long way towards making up for the deficiencies of the R75's S-AM mode in that it permits me to listen to AM broadcasts in ECSS mode with near-AM fidelity and with minimal fading distortion.

If I had to choose only one of these filters and get rid of the other, I'd give up the FL-103. However, I'm reasonably satisfied with what it does. My main purpose for choosing it was to give me an option for an additional bandwidth for AM and S-AM. Unfortunately, only the 6 kHz and 15 kHz 455 kHz IF filters may be used in S-AM mode (contrary to some reports I've read on the 'Net, the FL-257 may be used in AM (but not S-AM) mode (yes, I tried it :-))). Therefore, I chose the

FL-103 to give me a 9 mHz IF filter a little wider than the stock 2.4 kHz filter. For AM and S-AM modes, I've set up my filter combos like this:

9 mHz	455 kHz
(S-)AM-N	2.8 kHz	15 kHz
(S-)AM	15 kHz	6 kHz
(S-)AM-W	15 kHz	15 kHz (useless except for local MW broadcasters)

In both AM and S-AM modes, I can use the outer PBT control to select either the upper or lower sideband. In S-AM mode, this gives me, in effect, selectable sidebands while the synchronous detector is activated.[1]

Thanks to the wider bandwidth of the FL-103 versus the stock 2.4 kHz filter, I have noticeably better fidelity when selecting a single sideband in AM or S-AM mode. This gives me a decent alternative to ECSS with a bit less fidelity than the 3.3 kHz filter but which retains the familiar AM sound. Distortion on rapidly fading signals compared with normal double sideband AM is reduced by using the (S-)AM-N filter combo in conjunction with the outer PBT control, but not to such a degree as when using ECSS.

Having said all that, I cannot say that the FL-103 really helps make S-AM wonderful. Although to my ears S-AM provides a subtle reduction in fading distortion so long as the RF gain is reduced a notch or two, it is indeed a _subtle_ reduction in itself (in fact, I think cutting back on RF gain does more than S-AM to reduce fading distortion). I can't blame other reviewers for missing it. However, I think I can defend the R75's S-AM mode by suggesting that it be viewed as a small tool in its extensive toolkit of signal-manipulation features rather than a big tool as it seems to be in other receivers. Judging by the reviews I've read, the selectable AM synchronous detectors in radios by Sony, Drake, etc., essentially do what the R75's S-AM mode does in conjunction with its filter menu and PBT and RF gain controls. In other words, whereas with Sony, etc., you just press one button, with the stock R75 it's not enough to just turn on S-AM: you need to make other adjustments in order to derive any benefit from it. Unfortunately, the R75's manual does nothing to explain how to make use of what limited function S-AM does provide. The lack of a stock 3-4 kHz bandwidth suitable for use with the PBT control in S-AM mode doesn't help matters (I'm aware of Kiwa's 3.8 kHz filter). The FL-103 helps, but not enough to make S-AM mode more attractive than ECSS mode for listening to AM signals suffering from selective fading.

In summary, the FL-257 provides near-AM fidelity to SSB and ECSS signals, whereas the FL-103 provides noticable, but not great, improvement for listening to one sideband in AM or S-AM mode. Of course, the R75's native AM audio--if the RF gain is backed off to

reduce audio clipping--is itself perfectly acceptable for many signals, and S-AM also helps a little. The combination of these optional filters with the R75's stock features gives me more options for listening to SW broadcasts without undue discomfort. Other receivers may provide more pleasing audio "out of the box" for program listening, but I strongly suspect that few of them can match the R75 for the sheer quantity of tools it offers the SWL for making sub-optimal signals listenable.

Dave

[1] Some reviews of the R75 claim that the PBT control is non-functional in S-AM mode. That's true when using the normal and wide filters, but if S-AM-N is set up to use 2.4 kHz/15 kHz, the outer PBT control is in fact operational in S-AM mode. Thus, it could be argued that the R75 does in fact have a selectable-sideband synchronous detector, albeit one with rather limited bandwidth.

Great post, Dave. Very timely for a discussion going on in rec.radio.shortwave. I too like the FL-257 very much. Glad I bought it. It makes the R-75 a whole different radio for broadcast listening. On the other hand, I just read a post from a guy who hated it and bought the 2.8 instead. Just proves how subjective radio listening can be. I think the 3.3 gives me what I wanted, and I'm very happy with it. I wish I had room for the 2.8 as well, but I listen to a LOT of ham radio and bought the FL-223 for when the bands get crowded and the SSB "audiophiles" (now *there* is an oxymoron) crank up their equalizers a couple of kiloherz away.

Your post clarifies a lot and should help a lot of people who are trying to decide which filters to buy.

I think the manual probably says the PBT is ineffective with S-AM because it only shifts 1.5 khz. I think you'd be hard pressed to notice this with the stock filters.

LOL, Didn't it just KILL you to spend as much on a filter as what you'd spend on a halfway decent portable?

I've been lurking there, so I've been watching that discussion.

> I too like the FL-257 very much. Glad I bought it. It makes the R-75
> a whole different radio for broadcast listening.

Last night, I had a chance to listen to the BBC World Service at 9915 kHz for quite a while with the FL-257 (paired with the stock 15 mHz filter) in ECSS mode. I was very pleased with the audio quality and the lack of fading distortion. The program material was mostly speech, but the little snippets of background music sounded very good. I found it hard to believe that I was actually listening in SSB mode. Later on, I listened to a station with lots of selective fading; I think it was All India Radio at 11620 kHz. Again, the FL-257 acquitted itself well. The only trick with these stations, and quite a number of others, is to tune up or down by 10 or 20 Hz until USB and LSB sound pretty much identical (some stations such as WWV don't need such tweaking). With ECSS audio like this, who needs synchronous selectable sideband anyway? :-)

I enjoy "eavesdropping" on the hams a little bit, too. The FL-257 is nice for those hams who have a bit of free spectrum around them. For my limited needs, I find that the stock 2.4 kHz filters are sufficient for the ham bands if I use the PBT controls judiciously.

As I mentioned in a footnote, the PBT works with S-AM and the stock filters if you use the 2.4 kHz filter as the 9 mHz IF filter. I agree that the PBT does very little with the normal 15 kHz/6 kHz (S-)AM combo, although with that combo the PBT is sometimes useful for cutting off heterodynes on the edge of the bandwidth.

> LOL, Didn't it just KILL you to spend as much on a filter as what
> you'd spend on a halfway decent portable?

Yeah, I know. One could say that the R75 is the inkjet printer of SW receivers: a cheap base price but _really_ expensive accessories. Thankfully we don't have to replace our R75 filters every 1,000 pages. :-)

1037. HF Weather Fax Reception with R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-01-31 21:12:23 UTC
From: Gerry Busch
Topic: 1037 Message: 1037

I'm currently using the ICOM R75 with WXSat software to decode radiofacsimile transmissions from various coastal stations. This is done through a simple audio connection between the tape output jack and my soundcard's microphone input. Everything works far better than I expected, but I wonder if anyone else has tried fax reception on the R75. If so, which settings do you use?

I've tried various modes and offsets, and all of them work to some degree. For a while I was using RTTY mode with both filters at 2.4 kHz, and tuning the receiver about 0.2 kHz lower than the listed frequency, i.e. I decoded the 17151.2 kHz Pacific weather broadcasts from NOAA by tuning to 17151.0 kHz in RTTY mode (normal, not reverse). I've now discovered that USB gives me a better picture, because I can take better advantage of the twin PBT. This lets me filter out a lot more of the background noise (esp. from the PC), despite the fact that I use the same filter widths in either mode. After lots of experimentation, I have settled on an offset of -1.2 kHz, i.e. the 17151.2 kHz signal decodes best when I tune it in at 17150.0 upper sideband. This offset and mode works better for RTTY signals, too, so I have stopped using the R75's RTTY mode altogether.

A couple of references I have (one of them from NOAA itself) indicate that I should actually be using a frequency offset of -1.9 kHz, but the pitch seems much too high when I try that, and the fax program loses sync.

Input, anyone?

Gerry

Have you tried zero-beating WWV at 15 or 20 Mhz to see if your radio's on frequency? Although it seems that 700 Hz would be off way more than most R75s. They're pretty good from the factory.

No, judging by WWV the radio isn't off by more than 20 hz. I think this has more to do with my own lack of knowledge about the tuning of fax signals. I can actually vary the pitch quite a bit before I lose the image altogether, and so I don't know how high the pitch is actually supposed to be.

Hi Gerry,

Try Jvcomm32. Here:

http://www.jvcomm.de/indexe.html

This is the best software I could find for HFFAX and SSTV. The shareware version stamps each picture with "JVcomm32" but I don't mind it. It has a spectrum display which makes the fine tuning of the signals very easy. R75 is very good at digital signals because of its stability and 1/10Hz tuning. Use the dual PBT to "frame" the received signal.

Best regards,

Rado

Thanks, Rado. I'm satisfied enough with WXSAT's results not to bother downloading Jvcomm32, at least for the time being. BTW, I use TrueTTY for my RTTY monitoring and CWGET for Morse code. Both of them are shareware by Sergei Podstrigailo (http://www.dxsoft.com), and simple to use. Of course, as you say, the R75 makes digital reception very easy.

Hi,
I have a R75 which is a nice receiver, after adding all the filters, Stability Oscillators I end up to spending over $1000 or close to it. The DSP works well on stronger signals to remove noise but distorts the voice some (even at a level 3-4 setting), on weak signals. I had been trying to sell my R75 for $700 with over $1,100 invested, offers would come in at $650 tops, that told me that putting more money into this unit when Icom seems to cheapen the price regulary was dumb, but I had already bought them. I decided to purchase another receiver to compare side by side with the R75 since I wasn't happy with the performance after all I added, I was used to a NRD535D and a Icom 71A, both the best in their day. I purchased a RX350 by TenTec and wow! Quiet, plus all the filters that you can choose from (34), is amazing, just a turn of the bandwidth knob and you are actually listening to what you wish to hear instead of trying to get the signal in clear by tuning several knobs, buttons only to find out the signal has faded and gone, but you tried your best to hear it. I don't sell for TenTec but I have to tell you, they have a winner here and its priced right. If you wish to enter freq's via keypad you will need to purchase it seperate, its worth it to be able to sit in your chair and sit back and tune the world.

MY 2cents worth of opinion with 12+ years of monitoring experience. My whole reveiw on rx350 is on the yahoo groups if you wish to read it.

Thanks very much for that; it turns out that the pitch of the sample weather fax and the pitch I've been using on the ICOM R75 are dead on!

As Rado has mentioned, this receiver is very good at decoding digital signals. Besides weather fax, I've had very little difficulty decoding CW, RTTY, FEC-AMTOR, PSK31 and ham AX25 packet transmissions.

My first experiences with RTTY were about 15 years ago, when I bought a little RTTY reader with a one-line LED display. At that time I faced the frustration of using a rather unstable receiver, the Radio Shack DX-302, and had to keep my hand on the tuning knob at all times. The tuning wasn't fine enough, either. When that receiver bit the dust - albeit prematurely - I bought a Sony ICF-2010, which was more stable, but it tuned in 100 kHz increments at best, so it was still hard to get decent RTTY performance.

The reader itself was primitive, too. PC software has changed all that, although my computer radiates into the receiver pretty severely, regardless of all the preventative measures I've taken. The twin PBT helps me in that regard by narrowing the passband.

Ron:

i'll pay devils advocate: what exactly were you unhappy about with your R-75? i bought mine for $570 with DSP... that's less than half the RX-350's price. Is the RX-350's display better than the R-75's? how about the buttons? what about the controls (AF, RF, TS)? is it more sensitive? more stable? better dynamic range? better image rejection? is the reception significantly better than the $300 RX-320? if not i could buy a filter, RX-320, and R-75 for the price of the RX-350.

the R-75 doesn't have 34 bandwidths; however, the PBT's allow bandwidths from 1 to 2.4 kHz. btw, how does FM sound? is the RX-350 honestly better than the R-75 for utilities? how about for SWLing? is it better than a Drake R8B for SWLing? after paying for a keypad the price is right up there with the Drake.

phil :)

From: Ron M
Topic: 1044 Message: 1049

Phil,
You can read the specs about the rx350 at the TenTec web site or Universal Radio web site. I am not unhappy with my R75, its a great receiver for the money but again when you start adding other items it adds up, for example: buy 2 filters as most users are doing, thats almost $300 added to the original cost, now your investment is almost $900. I had my mint condition R75 with over $1100 invested as I stated for a long time on all the reliable sites, no takers at a very fair price of $700. even if you didn't want the adds I had that was a great price just for the filters alone, that is my point, if you are intending to enhance a great $600 receiver up to that kind of value then consider one that already has them as standard features and better technology, something else besides the rx350 even, we all have different tastes and monitoring conditions to consider.

NR on the rx350 outperforms the NR on the R75, lets face it there is a difference right off the bat with IF DSP compared to AF DSP, the R75 NR is even adjustable, the rx350 isn't but will be in the future. That is the beauty of this receiver, when the company upgrades or adds features every user gets them for free. I really believe you are getting more than your moneys worth with this kind of service.

Do I really think the rx350 is better for Utility DXing? YES! that is mostly what I listen to. It is much quieter than the R75 therefore allowing the signal thats in the noise level on the R75 be heard well on the rx350. What little SWLing I do the receiver seemed to work fine especially the S-AM, which works on the rx350, if you know what I mean. Initially the S-AM was set incorrectly on the first set of receivers but with a simple upgrade off the web its fixed and working well.

I never owned a Drake receiver before so I can't compare them, I believe the R8B has a great reputation for SWLing and sound. As far as the TenTec rx320, I don't know a thing about it either. See I'm not a tech with equipment to tell you if the dynamic range, image rejection, etc. is better or not, but I can tell you from real experience in one of the hardest areas to DX from, the west coast, that the rx350 is better than my NRD535D that I had and thought was one of the best in its class.

Some will make a big deal about purchasing the keypad separately but its not a big deal, in fact there are a number of benefits, one being able to sit back and relax instead of sitting over the receiver, and I know all about that.

You know in this hobby we tend to spend what we can afford and stretch it from there. I am one who spent all the extra money for the R75 wanting it to be a fantastic receiver and got a little better one, so I know what its like to over do it. I plan on keeping the R75 as it will be a great

secondary unit, just not that great as an $1100 one.

Ron:

thanks for the reply. i agree that the R-75's filters are a little steep in cost. part of the problem IMO is that we are all looking for that silver bullet. i might buy a filter for my R-75 but its not going to perform miracles. if i want bang for the buck spending $10 on some wire and building another antenna will get me further.

in a side by side comparison what have you noticed for UTE dxing? i am all ears! i am sure there are a lot of others who would like to get the scoop too.

i know what you mean about people 'stretching' what they have. i've already decided that if there is a 'next' unit for me it'll be an RX-340 or what ICOM has brewing as an R-75 replacement if they put in their 32-bit DSP (ala 756 Pro). i'm not going to end up purchasing 20 units (that's what we all say lol) :).

phil :)

Phil,
When you have your earphones on and the noise level is right up there with the faint voice your dying to hear and you tune your heart out and just can't get it to where its legible, well the rx350 takes you to legibility! and fast. I'll give you an example of a com I was trying to hear, it was noisy as it usually is here so I changed the bandwidth up to 3.9kHz (changed to one of the 34 filters), wide yes but voice was clearer in with the noise level and it didn't matter that the wide filter added another level of noise because then I turned on the DSP NR and I was almost in heaven, there was the voice clear and readable, yes it has some of the DSP digital tone to it but its clear, you need to turn up the volume some when the NR is turned on when listening to weak signals like I do.
A bonus is the screen that the rx350 has, its LCD, the clock is present while all other info is shown there also including Alpha Tags. The spectrum sweep display gives you up to a 2.4 MHz spread of activity to view and is a nice feature. Having 128 channels per bank is really nice especially with 8 total banks, now I can have all the AF freqs in one, special operations freqs in another etc.
I believe the TenTec folks have incorporated a lot of what they learned with the rx340 which I also was considering, after all I'm never satisfied especially when the next distant signal is there and you want so much to hear that one to, but I thought I'd try this 350 out since the Transceiver version, Jupiter, was getting great reviews, in fact, it was one of the 10 items to buy for the holidays in Monitoring Times last December page 74.

as i understand it you can still hook them up if you get the model
that has the jack (541-M version) or if you just wrap a wire around
the outside perimeter and put the two ends into the 500 ohm terminals
in back of the radio. maybe the antenna experts will come in and set
us all straight.

Hi folks -

For what it's worth to potential shoppers, I got my R75, the Kiwa mods, an Inrad filter, and an ICOM filter for less than $1000 and it works just great - far better than the Drake R8B which I tested and which would have been about $1300 plus. I'm pretty pleased. I'm also pleased to hear people are very happy with ther TT RX350... When they want to, TenTec can do great things. If you're a cw op - TenTec is your place to be! 73/Tim Logan KB7OEX

From: Enrique A. Wembagher
Topic: 1037 Message: 1055

Gerry,
I use for multimode signals a RadioRaft program, this decode automatically the signals received. ex: baudot, pactor, and others; for Wefax signals I use JVfax 7.0 (freeware).
They work in MS-DOS and they don't need big hardware requirements.
Just you should connect a comparator interface among in R75 (rec out) and COM1 or COM2 of your PC.
See more details:

http://www.TheOffice.net/RadioRaft for download RadioRaft free version

http://www.hffax.de for download JVFAX 7.0 or 7.1

Saludos
Enrique

1056. Diamond Discone with R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-03 13:28:11 UTC
From: sd4643
Topic: 1056 Message: 1056

Help, newbie question about using Discone antenna with a R75 will I get decent coverage? TIA, Stan

1057. R75 AM sensivity

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-03 16:37:39 UTC
From: Sarmento Fernandes R Campos
Topic: 1057 Message: 1057

Hi

I've just purchased a R75 and it seems that its AM sensivity is limited by
an specific atenuator.

Does anyone knows how to disable it ?

Regards

Sarmento Campos

Sarmento:

you are correct, there is an attenuator. check message #178 about how to disable it. as i understand it involves soldering together two half-moon pads in the left rear of the unit on the printed circuit board. see the files section for a photo of the region.

> get decent coverage? TIA, Stan

Not really. The Diamond Discone is for VHF/UHF reception in the
25-1300 MHz range and really has very little gain. It may work
adequately for the 25-54 MHz coverage of the R75 though.

A trick you could do if you already have an existing Discone antenna
installed is to just plug the center pin of the connector into the radio
leaving the ground portion completely disconnected from the radio.
This will allow your lead in wire and the antenna to both receive in a
lower range than the Discone would normally. But, as a result of this
your coax will not be shielded from any interference(computers,etc)
along the path to the antenna.

If you don't currently have an antenna consider a dipole or end-fed
wire outside in the open for best reception. There are many indoor
antennas available too but you will find many things can interfere with
your reception. Even a telescoping antenna with a 90 degree adapter
can work in a worst case scenario. The two preamps on the R75
can bring the signal up but they also introduce noise as well.

Your local Radio Shack shortwave antenna or other source such
as Groves SkyWire would probably work fine as a starter antenna.

http://www.grove-ent.com/ANT2.html

The sky is the limit when it comes to antennas!!!!! Check out the
outrageous price on this antenna:

http://www.grove-ent.com/AX12B.html

Wonder how many of those he sells?

Good Luck!
Eddie

1060. Alignment

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-04 03:41:19 UTC
From: Gerry
Topic: 1060 Message: 1060

Not a question, just thought I'd share some experiences with the group: I recently discovered K2UHC's simple instructions in this group's file section for correcting the slight frequency error in the ICOM R75. Last night I finally got up the nerve to try the procedure, and it worked like a charm; not only is it now much easier to listen to shortwave AM music broadcasts in USB mode, but the speech on USB utility transmissions also sounds perfectly natural without having to detune slightly as before.

I should mention the nasty scare I got while carrying out the alignment, however: The crystal suddenly stopped oscillating, and the receiver went totally dead on all frequencies. I powered it down, then up again, but still no reception whatsoever. I nearly panicked until I remembered that I had had similar experiences with other radios in the past, including low-tech ones built in the 1930's. To solve the problem, I simply turned the ferrite slug counterclockwise nearly to the top of its travel, shut off the receiver then switched it back on. The crystal went back into oscillation, upon which I turned the slug back in and was then able to complete the task of correcting the frequency error. I got pretty close; the error used to be anywhere from 15 to 30 hz, but is now only 4 hz. when tuned to WWV at 10 mHz, 5 hz. at 15 mHz, and 7 hz. at 20 mHz. I may try tweaking it even closer when I get a chance.

BTW, when listening to shortwave AM broadcasts in USB mode (to reduce the effect of fading), I often use the widest filter possible if there is no interference from an adjacent station - i.e. both of the standard filters set to 15 kHz. The sound is much more pleasant that way. No, I've never tried the S-AM mods, because I have neither the expertise nor the proper equipment here to do so. Comparing the sound of AM in wide USB mode on the ICOM to the sound of AM on my Sony ICF-2010 with its synch detector switched on, the ICOM performs far better, so I'm not too worried about synchronous detection.

Dan,
In any receiver it is very good!
Much of the used antenna depends, I use it to adapt the impedance of my Inverted V and rx.
Their syntonize stage allows to alleviate the work of the R75 or another rx, and the signal is very improved.
I usually use PREAMP 1 of the R75 and I place GAIN of the mfj in medium position.
I also use it in my Sangean 909 when I make dx expeditions and it is great help with longwires antennas.
A friend has a 1040B which allows to connect 2 antennas and it is identical electronically at the 1045c, only some small differences.
You can choose anyone of them.

Hello Dan,
I have the MFJ-1040B which I got used at a very good price.
Frankly, it serves 2 purposes. It is used as an A/B switch when I want to do comparisons between 2 receivers with the same antenna and it serves as a switch to disconnect the antenna when not in use to protect it from any static electricity the antenna may pick up. My antenna is a 75 foot (25m) wire antenna and the R-75 has more than enough sensitivity for any of my needs and amplifying the signal any more usually just amplifies the noise. I have used it with a few receivers that are low in sensitivity and it makes a big difference, but if your R-75 is working properly, you really don't need it.

YES! I use the MFJ-1045C all the time. Its great. I have a Ground Plane outdoor antenna which covers 20-1500Mhz and use the MFJ-1045C inline with it to the R-75. It does a GREAT job of tuning the antenna and the preamp amplifies the signal after its preselected thus getting rid of most of the noise. I would'nt live without it.

I have the DSP with the R-75 and hardly use it. Frankly I wish I had just purchased an ANALOG Receiver instead of the R-75, it takes a while to get used to its quietness and is harder to tune than the analog types although I like the digital readout.

:-)

Ahh, a masochist, eh? ;-) Around here, I find the R75 is plenty noisy - noisier than my analog sets in many cases; the DSP is essential - I couldn't stand the noise without it.

> and is harder to tune than the analog types although
I like the digital readout.<

I'd love to hear why you think the incredibly easy-to-tune R75 is harder to tune in than, say, a Realistic DX-160. I have both, and finding the right station on the right frequency is easier by a *country mile* on the R75, and that's on AM. When you're talking SSB or ECSS tuning, that difference changes to a light-year.

My R75 is in the mail (UPS). The most convenient location for the receiver is going to be on the same desk that holds my PC. The radio would be about 18 - 24 inches from tower and 8 inches from the monitor. Is being so close to the computer equipment going to cause any noise problems? I would assume using the Antenna #1 connection would allow less interference than the bare wire antenna #2 connection. Any ideas or opinions would be welcome and appreciated.

Sean:

for what it is worth my laptop inches away from the unit causes no problems unless the RS-232 is hooked up because the trackpad is putting out some RF noise through it. monitors can sometimes cause problems. congratulations on your choice... you're going to like your R-75!

I have my R75 in between two desktops, within 6 inches of one of the
monitors and I receive little or no interference, although that
changes as the frequency received changes. I don't use ANT2 so I can't
address that issue.

I'm beginning to think that the amount of RFI depends on the make of the computer. This is my second (and definitely my LAST) Compaq, it is a laptop, and nothing has helped me eradicate the noise from the keyboard, processor, mouse, etc. -- even the power adapter; the monitor is the least of my worries. I often power down the computer altogether so I can enjoy shortwave reception, unless I'm using RTTY decoding software, of course.

If I boot up my old Compaq, which is a desktop at the other end of the house, I can even hear that one on some SW frequencies.

I'm using coax feedline to ANT1, and the antenna is outside the house. Ferrite beads have accomplished absolutely nothing.

1073. Yet another AM audio tip

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-07 16:16:49 UTC
From: Dave Ulrick
Topic: 1073 Message: 1073

Hi,

I've had my R75 for over a month, but I'm still learning about cool things I can do with it.

While searching the Internet the other day, I found an old post with a tip on how to use the R75's RF gain control in conjunction with AGC OFF to reduce AM fading distortion. In essence, you do something like the following. For this to work, you have to use the SET menu to enable the RF gain control; the R75's factory settings disable RF gain. Try this procedure with a rapidly fading SW broadcaster that causes a lot of audio "pumping".

1. With F.AGC activated and with "P HOLD" turned off (via the SET menu), note the highest reading of the S-meter.

2. Turn the RF gain counter-clockwise until the S-meter is "stuck" reading just about the same as, or a little higher than, the peak reading. You may already notice a dramatic reduction in fading. If you're satisfied with what you hear, there's no need to proceed to the next step.

3. Hold down the AGC button until "AGC OFF" shows up on the display, and adjust the RF gain control until the S-meter again matches or slightly exceeds the peak reading from step 1. If you still hear a little "pumping", turn RF gain a bit counter-clockwise. If the signal seems to "cut out" once in a while, turn RF gain clockwise until it stabilizes.

I've played around with this method on quite a few stations. Given a station which suffers from rapid fading, this technique can often give you very stable audio without having to resort to ECSS (although ECSS usually gives even _more_ stable audio).

A bonus, albeit often a small one, is that the S-AM mode seems to work most effectively when this method is first used to eliminate the AGC "pumping". I've used the SET menu to permanently turn on the S-AM detector. This seems to make the S-AM detector "lock" a bit better. It seems that if I do steps 1 and 2 in AM mode, then switch to S-AM mode before turning the AGC off, the audio is sometimes a little more stable (voices have less of a "flutter" effect) than if I stick to AM mode. You might find it be most convenient to leave AGC OFF in S-AM mode; if you do so, you can switch to S-AM and turn AGC OFF with the press of one button. On the other hand, you may find that the RF gain/AGC OFF trick itself does enough to stabilize the R75's AM audio that there's no need to mess with S-AM.

So far, I'm quite impressed by the results I've gotten with this technique. This trick combined with the R75's excellent ECSS performance (especially with the optional 3.3 kHz filter) helps persuade me that the R75 is a better program listening radio than many reviews might lead us to believe. Unfortunately, some of the R75's default settings (e.g., RF gain disabled and S-AM set to automatic) don't make this radio sound its best in its (S-)AM mode, and ICOM's manual for the R75 doesn't exactly go out of its way to explain _how_ to use the receiver's controls most effectively. Perhaps those of us who use the R75 should work together to create a HOWTO or FAQ with tips such as this one. If you're already working on such a site (Phil?), feel free to include this post.

Disclaimer: the technique I describe is an old, old one that I've seen mentioned in several books and Internet postings. SWLs have used it for many, many years. I make no claim to be its inventor.

No, I don't have a LAN card in either machine. I access the internet via a dialup connection, and I'm usually offline when listening. BTW, the only physical connection between the receiver and the laptop is from the receiver's tape output jack to the soundcard (for RTTY, etc.), but I get just as much interference when I unplug the patch cord at both ends.

To Sean, who started this thread: Not to worry; your new ICOM R75 is very well shielded; the interference is definitely not the receiver's fault.

When I place my R-75 near my desktop computer (5-6 feet away), I get terrible noise. This is with a longwire antenna so a coax arrangement would probably help. When I tried it with a Gateway notebook computer, no noise at all. My latest experimet was to string out six 9-pin RS-232 cables together (about 35 feet) and make a 40 foot 1/8" to 1/8" plug twisted pair wire and put the radio in another room to be controlled by the computer. RS-232 is rated only to go about 12 feet, but this arrangement worked fine, even the sound was fine through the soundcard and speakers. It was good enough to catch PSK31 QSO's, SWBC listening and some CW decoding.

Would I use it as a permanent solution, no. But it worked :)

Yesirree. It's good for OTHER radios too! Also a useful step in
pinpointing the cause of distortion (through process of elimination)
by comparing the sound achieved from this method to sound achieved
with the AGC on.

Amen to that! I have the same problem. The hub is in the basement and my R-75 is on the first floor above it and it obliterates weak signals on the radio. Does anybody have ideas for quieting it down? My R-75 is plugged into a commercial grade Isobar filtered power strip and my antenna feedline is not running near the hub.

Where did you hear the "12 foot rule" from? I have
been using a 25 foot homebrew serial cable for months
now with no problems (my R-75 is in another room than
the PC is. The cable runs from the PC through the
floor to the basement and up through the floor again
into the living room where my receiver is.) At work,
we also use serial cables of 20 and 30 foot lenghts to
control environmental chambers from a PC. I don't know
what the actual limit is for a serial cable, but my
experience has been that it is greater than 12 feet.

Bob,

Honest, that's the spec! However, of all specs that have been violated over the years the RS232 one has to be the worst. You'd have trouble finding any piece of equipment that cannot do better than the spec.

(Other violations involve what is 1 and 0 on the signal lines. Cheap GPS cables that connect NMEA to RS-232 count on the UARTS being "loose" with the interpretation of 1 and 0 to transfer the data -- a proper cable would have an RS232 driver in it.)

At the extreme case, I had a former employer that ran RS232 lines outside for over a quarter mile carrying data at 19.2. Never could get budget for fiber optics but always got money to replace blown out RS232 drivers... sigh...

That's interesting, Eric. I never would have imagined.
Guess we blew that spec out of the water! It would be
interesting to see just how long one could go with a cable.

Hello KG6GIY,

Use an outside antenna if possible with shielded coax.

I have a desktop computer by my R75 here and it does create problems.
Mainly the Monitor and ..believe it or not.. the printer interferes with it
too.
The power supply for my HP printer and my Motorola BroadBand
Modem were both troublemakers. When you get your R75 you will
certainly know who the offenders are pretty quick. It was surprising to
me on the Sony monitor because I opened it up and looked around inside
of it and it has extensive metal shielding inside. I have heard of spraying
the monitor plastic casing with a conductive metalized paint to increase the
shielding but have not gone that far. And there are ferrite cores you could
install on the interconnecting cables on your accessories connected
to your computer to reduce interference too.

Again an outside/external antenna is preferable but relocation of the
R75 could prevent the interference problems too. But, I think most people
like to surf and Shortwave at the same time so it can be a nuisance. I
currently just accept whatever noise is present here when the computer
is on and have found not all frequencies are blanketed by it. But it's
quite a few!

Good Luck on you new R75! I think you will be happy with it.

Sean,

It is a complex subject in eliminating noise in radios caused by computers. First you need to determine how much noise there is and then you can work on eliminating it. I have a number of radios and computers in my shack, so I have some experience in eliminating the problems.

Get it set up and see how things are then get back to me and I will post the solutions via the list.

As for Phil (just_rtfm), the RS232 ports can be one of the biggest culprits. In Desktop systems the metal case is earthed to the mains supply and the where the RS232 exits the case it is important to ensure that the outer part of the RS232 port (9 pin connector) is also earthed to the case. It make look like it is, but the spray painting of the case may be causing it to be insulated. Take the system apart and remove the paint on the inside of the case to ensure that there is a good connection, same goes for all items that exit the case. So Phil, you can look at the same thing for the laptop, but with a plastic case then there is a problem. Get a high quality RS232 cable (or make one) that uses shielded cable and ensure again that the outer part of the RS232 connector is connected to that shield. Also try Ferrite suppressors (clamp on type) on the cable at both ends.

Regards

"A little inaccuracy saves tons of explanation."

Actually that *WAS* the spec. RS232 went through at least 5
revisions, and is now called, I think, EIA-232-E. Or something
like that. Who knows any more? Where's the Firewire port on
my radio?

Many years ago I was commissioned to do a study on RS232 cables and the specs (there are many) and things have settled for RS232C, the 'C' being a particular spec, (there are more ways to wire a RS232 cable than you think). I will need to search my attic for the papers I wrote, but if I remember correctly the max distance was around 300 feet.

Seems that lots of people have got computer noise problems in their radios, Can't write anything just at this minute as I have to leave for a few hours

Will get back with some answers later today.

hello Dave:

thank you for the tip. i was given a similar tip by Bryant that i put on my site (still as yet on my hard drive, my ISP's servers are still not online... argh!). i have about 10+ tips and lots of pictures and sound files. i am somewhat unsure of how the site will be 'taken' since i gathered information from all over the web. i just wanted to put up a site that i wish was out there a few months ago when i re-entered the hobby. btw, that is the first tip... it is a very good one indeed!

phil :)

Having some experience in this area, I can tell you this is more an issue with how good a ground you use and how far the antenna is from the computer, than the actual radio.

The first thing to do is get the antenna as far away from the house as possible. Not only does this reduce any noise generated from the computer, but TVs, VCRs, DVDs... you name it.

The second thing to do is to ensure that the shield of the coax is well grounded. Nominally, this can occur in two places: 1) as close as possible to where the coax leaves the house, and 2) as close as possible to where the coax meets the antenna. I used to think that a good ground was myth (especially when you live in the foothills of the Blue Ridge), but after installed a ground system this past Winter, I was convinced at what an improvement it makes. Well worth the effort, and I think some of my recent logs speak for themselves.

The third thing to do is to use as many toroids as possible on every bloody cable and power line in and out of your computer. This won't affect the noise entering *through* the cable as someone mentioned, but it will significantly reduce any noise that is inductively re-introduced from the monitor, and the computer's clocking signal.

If you've got the money, I recommend getting a flat panel display instead of a CRT, since they don't radiate nearly as much. If you're stuck with a CRT display, I recommend you *don't* try using a conductive spray inside the monitor case. Not only is it a dangerous task for people that have never opened a TV before (ever see a TV deflection yolk fry something or someone?), but most modern CRT displays already have the coating. Most of the radiation will be through the glass anyway, so unless you have a TEMPEST-proof monitor there's not much you can do - again, get the antenna *away* from the house.

Laptops can be less noisy *if* you run from batteries and not from a switching power supply. Most laptop screens do not radiate much and are a lot quieter than desktop CRTs (see my flat-panel recommendation above - same theory). Most switching power supplies are extremely noisy because of the nature of DC-DC conversion going on. Anything with a square wave is going to theoretically create harmonics all the way up the spectrum.

Hi all

Just thought i'd post an introductory msg !

Got my R-75 in September 1999, to replace a Kenwood R-2000 - And i must admit - the 75s a great receiver!

Haven't done any mods, admittedly i don't use the S-AM feature that much, wasn't aware that it didn't work totally!

Mainly use the 75 for Data Modes, FAX/SSTV/RTTY etc, and BC band listening!

sorry its a bit of a short intro!

Mark

Mark Fine. Hmmm. Fineware?

Your software is too good to even WANT to steal.
As soon as I can figure out where to put my R75 so that I can get the most of your product, I'll BUY it.

Nice work.

So far i use th ANT2 as my antenna connection . What i can say is still with random wire there are not so significant problems with my monitor . Only carriers and a little higher noise level on freqs above 12 mHz .

I had nearly same carrier levels when i conencted a trial dipole

My monitor is half meter far from receiver. Receiver is also connected with computer vbia a 9 pin cable

If you can use a coax feed in for Ant 1,that might help
and consider putting soe sort of vented RF impenetrable surrounding
over 5 sides of your monitor;metal foil, metal scrteening, even
silveredplastic may help

Today I received my brand new R75. It works great. Just a copper wire of 5 mtrs, hooked to the Antenna #2, and the world is in my room. In the near future I hope to get an even better antenna and better shielded coax.

The R75 is appr. 6 feet and 9 feet from two desktops + monitors, I cannot detect any interference. The only thing that I occasionally hear is the remote control of my TV when I zap channels...:-)

I have my R75 in between two desktops, within 6 inches of one of the
monitors and I receive little or no interference, although that
changes as the frequency received changes. I don't use ANT2 so I can't
address that issue.

I have found it is not the location of the Receiver at all! Some CRAPPY computer monitors cause unacceptable noise. I trash the monitor when I find this problem, as it just isn't worth the hassle. I also never buy the same brand of monitor that I have a problem with ever again! SO I now have a VIEWSONIC 17GS (Great!). I have numerous radios, scanners etc and computer control them all, so reliability is a MUST! The R75 is great and joins my R7100 and others within 3 ft of my monitor and computer, and since I trashed the CRAPPY monitors I have NO Interference problems anymore. Also occaisionally I find a serial cable which is noisy, it joins the rest in the trash.

It is just TOO FRUSTRATING to deal with SUB-STANDARD manufacturers and equipment in this hobby! So manufacturer's listen up... If you want to sell to me it better be a QUALITY PRODUCT or you have lost my business FOREVER!

Hope this helps someone.

:-)

I m neither an antenna expert but one good idea for MW antenna is to turn
8 windings of wire onto 1x1 wooden frame .
then putting one wounding over this coil , put a 500 pf at least variable
capacitor to tune the antenna

this is the well known 'australian loop ' . Most hard core Medium wave DXers
use it

Some other sources i found QRMing radios:
-Television
-Energy saving lamps . They do the hardest noise across manuy bands
especially the lowest
-Nearby motors and egines (you can cut this noise with the NB)

in addition to :
-computer monitors
-computers
-printers
-pen partner over the receiver!

Anyone has suffered fromother sources please add to this list !

Most compact fluorescent lamps are not big noise sources. Occasionally, you'll get a bad one.

My neighbors have dimmers and touch lamps, but the buzz is usually not so bad that it covers up a signal.

Neon lamps, whether in doorbell buttons or aquarium heaters can be really problematic. Also, the Grainger photoelectric flood light switches and Zenith motion detector flood lights are viscious. (BB Gun time!!!)

1105. Curing Computer Noise in Radios - PART ONE

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-10 00:11:02 UTC
From: AutoTest
Topic: 1105 Message: 1105

Computer generated noise in radios is something I have had to deal with in my shack over the years. Since the request by Sean KG6GIY, there has been many suggestions as what to do. Below summarises what I have done or know can be done to correct the problem. It is a big subject so I will put this into a number of parts - This is part one

*** The Receiver

Plug the receiver into a filtered mains supply. A number of the surge protector power boards also have
mains filtering and if it also has connections for the phone so much the better. These boards help with the other items like - touch lamps, TVs, DVDs etc.

Try using a Ferrite (clamp on) suppressor on the mains leads or wind the mains leads through a
ferrite ring, get as many turns possible for about three quarters of the ring. You can also use
ferrite rods, use three, taped together, and wind the power lead around all three the length of them,
use cable ties or string at each end.

Make sure the receiver is earthed. Connect this to a good separate earth. An 8ft copper clad steel
rod driven into the ground. Put it out in the open, if possible, so the ground around gets wet when
it rains and run a decent size wire to a terminal block (this is your earth terminal block) outside
your shack. Continue from the terminal block to the receiver's earth.

*** The Antenna

Keep the antenna as far from the computer as possible and bring the feed in using good quality co-ax
cable. Connect the outer braid to the 'earth terminal block' before continuing on to the receiver.

(This also gives you some lightening protection).

*** The Computer

*** Laptops

Many of the items below for desktop systems, also apply to laptops, so ensure you read that section
as well. The usual culprit is the switch mode power supply. Try a filtered power board to see if that
helps. Using the laptop's batteries can help you determine how bad the problem is, but using the

batteries all the time will mean they will be flat when you really want them. The answer to this is
to use Sealed Lead Acid batteries as an additional supply. A company called Targus sells a connector
that can power a laptop from a car's cigarette lighter. You can use this to connect to the SLA
batteries. I use three SLA's when I go portable with my radio and they last about 6 hours.

*** The Desktop system

The system itself generates a great deal of RF which is trying to get out. The objective is to stop
it escaping.

The outer metal case (or side panels) must make good electrical contact with the base. If the paint
on the case is stopping this happening scrape it away around the securing screws. Do this at as many
points as possible, fit additional screws.

The motherboard should make good contact with the base (earth). It probably does at some point but it
can be improved by replacing any nylon stand offs with brass ones. Check each one carefully with a
multimeter to ensure it should be earthed (some may need to be insulated).

For those people with plastic cases the best answer is to replace the case with a metal one. The form
factor is probably ATX but take the system the shop and tell them what you want to do and they will
provide you the right case for your system. You can paint the inside of the plastic case with
metallic paint or glue aluminium foil on the inside. However, remember that if any of the paint or
foil falls off (because of bad adhesion) into the motherboard then it could be goodbye system.

Many systems have a plastic front with removable plastic panels for CDROMs etc. If behind these
plastic panels there is a hole for a drive in the metal case, then cover these holes with a metal
plate.

Thus we now should have metal case which is completely enclosed. If your power supply is three pin
(active, neutral and earth) then the case will be connected to the earth via the power supply. You
can also connect this to your 'earth terminal block' which will provide some static discharge
protection and will help when we get around to discussing the monitor.

Leaving or entering the case now are items from installed cards, power supply cord, keyboard, mouse,
serial, parallel and usb ports.

For all these connectors ensure that the outer shells are making good contact with the case and that
any spray paint is not insulating them. If when checking you find that the outer shell of a connector
(say in this example, the video connector) is not connected electrically to the case then you can use
small grounding plates made from thin metal strip under the securing nuts either side of the
connector and to the case, (these are the nuts that hold the video cable securely in place).

As this is getting quite long, I will continue it in the next post.

Regards to all

My Dell Latitude laptop has a horribly noisy switching supply. Running it on its internal lithium battery completely cures my RFI.

I searched the Dell site, without success, for a non-switching, transformer operated 20VDC 3.5amp supply. Also looked at the Radio Shack site: found nothing.

Eventually I'll check some surplus sources. I'd bet there's something usable out there, somewhere. Also, have not yet investigated the reason for a three conductor cable and plugs between the Dell switching supply and the side of the laptop.

Sealed lead acid batteries are a good idea, but cumbersome, and seens to me not easy to get 20 volts, current limited to 3.5 amps.

Bob Laird

Hi All,

With my IC-R71A now being half-dead, I wanted to get
another radio.

Knowing about the 'not-so-hot' sync-AM performance of
the IC-R75, yet one of the few that will tune SSB at 1Hz
resolution, I decided to purchase this radio (May 2000).
It was $694.90 shipped, from "GROVE COMPUTER & RADIO".

99% of my use, is listening to local and world
AM broadcast. (AM shortwave, via the ECSS method.)

Radio is on, 24/7.

I set my stock radio to these settings:

Seeing that the filter settings can be adjusted for each
of the 6 different modes (AM, S-AM, SSB, CW, RTTY, and FM),
I adjusted the filters as follows:

EXP = oN
op1 = No
op2 = No

For SB / CW / RTTY (These three modes I have set the same):

(Note: Wide mode is only used to tune/zero-beat
AM signals via ECSS, unless it's indeed a SSB broadcast.
This is due to a 'strange' mixing of using the 15&15 or
or 15&6 kiloHertz filters together [via "EXP oN"].

Is there a modification to 'correct' this? If so,
I wouldn't need to purchase another filter for ECSS, yes/no?)

9M 455k

```
-----------------------
Normal 15 2.4
[N]arrow 2.4 2.4
[W]ide 15 6
```

For AM:

9M 455k

```
-----------------------
Normal 15 6
[N]arrow 2.4 2.4 *a
```

[W]ide 15 15

For S-AM / FM (These two modes I have set the same):

9M 455k

_____
Normal 15 6
[N]arrow 2.4 6
[W]ide 15 15

*a (For shifting away a strong local signal to
reveal a weak signal. Example: For me to
hear 1090 or 1110 AM and avoid WTAM 1100 AM
in Cleveland. This can also be done using
USB/LSB.)

Other optional settings (Pages 30-33 of manual):

RF/SQL = rS
AM NB = on (To select / de-select NB in AM mode.)
SAM SW = SA ("En" when surfing) [See "S-AM" below.]
CW PITCh = 30 (300Hz)
* TON = 1275 Hz (RTTY Mark Frequency)
* SFT = 425 Hz (RTTY Shift Width)

* Select any of the 3 options as needed to shift away
from interference when using RTTY-Rev or
CW-Rev ECSS listening.

Also:

ANT 1 (50 Ohm) (100-foot coax [50 or 75 Ohm, I don't remember which
I installed] to a Radio Shack dipole.)

ANT 2 (500 Ohm) (Not normally used, unless I need
to hear weaker signals on the
AM Broadcast - 530 - 1710kHz. If so, I connect
the center conducter of the PL-259, and the
shield to the ground terminal.)

Note: A cheap real-quick adapter - carefully re-shaped
paper clips (not the non-conducting color-coated
type... duh), and/or crocodile clip leads.

:D

AGC = As needed, Off/Fast/Slow. (I wish there was a slower option!)
(I liked the slower AGC on the R-71A. Why not with the R-75?)

NB = (Usually left off. Some noises and/or the same type of
noise, sometimes are 'blanked', and/or are blanked or reduced
at some frequencies, but not others.)

S-AM = (Somewhat useful.) Question - Is there such a radio that eliminates signal fade-distortion 100% during S-AM?

Anyway, are not volume dynamics more uniform in ECSS mode versus S-AM, yes/no? (From what I've heard so far, I think it is.) Besides, when a signal rises or drops, so does the audio if one is using the S-AM or AM - RF-adjust combo. (Not pretty for unattended recordings.)

Options:

[] I may buy the High Stability Crystal Unit (CR-282) at some point. (Room Temperature shift = Frequency shift. Sort of a problem when using the ECSS method with 1Hz tuning and unattended timer-set recordings.)

[] Perhaps the DSP unit, too.

Audio: Some distortion noted in ECSS.

Display: LCD - Yes! Quiet vs the R71A's noisy florescent display.

Anyone on this YeyHoo Group may comment / suggest / critique my setup / usage.
Suggestions for any options and modifications for ECSS listening are welcome.

Go ahead, make my day... reply if you dare.

Hello Patrick,
I certainly hope you are using an external speaker for SWL. It
really makes a difference and shows that the R-75 really can sound
good! The internal speaker seems to have been optimized for SSB
communications and really doesn't do the radio justice when listening
to good fidelity broadcasts.

1110. FS: R75 with filters & KIWA mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-14 20:04:58 UTC
From: kb7oex
Topic: 1110 Message: 1110

Hi folks -

I recently bought an ICOM 756PRO which includes general coverage. I've also found that I use my R75 much less than I thought I would. See my earlier posts to know how much I like the rig. I had the KIWA mods done and installed an Icom 2.8 filter on the 9Mhx board and an Inrad 1.8 on the 450 board. It has the DSP of course. I think the rig is an absolute charmer and, to be honest, it would not bother me if it doesn't sell - but I am not using it enough and can use the general coverage on the 756 (altho it certainly won't compare to general coverage on the R75). I think all of you know the price of the filters and Kiwa mods so I won't go into to detail. I would like $850 plus shipping. Thanks for reading this and have a great day!

hello Patrick:

> Go ahead, make my day... reply if you dare.

i liked your post, here are my 2 cents...

1 - use an external speaker such as amplified (with tone control)
computer speakers or even $2 earbuds (what i often use).

2 - some people on here have praised the 3.3 kHz filter for ECSS: it
is however an expensive filter. one trick i do is use AM mode narrow
(with dual 2.4 kHz filters) but decenter 1.2 kHz (either way) from
the original frequency. the result is louder than ECSS and the
frequency response appears different on a scope.

3 - once you get a station, turn down the RF gain, press and
hold 'AGC' two seconds (turns it OFF), and readjust RF gain till it
drops to S-10. this often helps. NOTE: remember to hit 'AGC' again
and turn it ON before going back to general tuning!

4 - the R-75 is very stable 'as is'. i would /not/ consider getting
the high stability crystal unless you need it for some special reason
like you're outside and the weather keeps varying.

5 - the DSP is excellent and to me a 'must'. if you hear noise this
will cut it down! some people claim it doesn't help very much...
might have to do with where they live (?).

phil :)

> Audio: Some distortion noted in ECSS.

About the above observations. Check this post:

http://groups.yahoo.com/group/icomr75/message/712

Also check the JPEG picture in the files section:

http://groups.yahoo.com/group/icomr75/files/Information/AGC%20audio%20mixing%20examples.jpg

There is audio backmixing through the AGC line into the RF chain. I fixed it by a small additional circuit in my R75 (three transistors as I remember). The circuit makes the AGC to be of a "hang" type. Now I have external pot which determines the AGC hang time - from 0 to about 3 seconds. The audio is much more pleasant with hang AGC. I did not publish this mod as it is rather difficult to perform and there is a simple workaround for the problem. Turn off the AGC and adjust the RF gain manually.

Best regards,

Rado

I know people have posted about antennas before, but I would still like to see what type yall are using. I am starting with a home made center fed dipole on my roof, each leg being approx. 33 feet long. No balun. Coax from antenna to radio. So far it seems to do well, although I am far from being an expert.

I use a folded dipole made out of 300 ohm twinlead. I run the twinlead out
of the dipole straight to the second antenna connection (no balun). Works
great with one drawback. The loss on the 300 ohm line to the radio means I
have the antenna very close to my radio.. i.e. in my bedroom, not outdoors.
This is a little noisey but otherwise I'm pretty impressed with it's
performance. Living in a third floor attic probably helps too.

Scott

My R-75 is fed with a single piece of 22g stranded, Teflon (r) coated wire about 120' long from a vent in my garage to a 30' mast in the corner of the yard sloping to the fence on the other side of the yard. Connected directly to the Hi-z input. Works great.

1118. I Am Curious???

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-15 18:34:25 UTC
From: woody07823
Topic: 1118 Message: 1118

Hello all.
This is my first post in the forum.
Just wanted to say thanks for all the great posts that benefit newbies like me.
On to the meat of the post.
I've got an R-75 coming in the near future from Universal Radio.
It'll be my first shortwave receiver and I couldn't be more excited.
I've read a lot about the "Kiwa" mods and was wondering if any of you had them done to your R-75's? Could you explain, in very simple terms, what the real world differences are from the unmodified receiver?
It looks like the total cost for the 450KHz filter upgrade, Synch. Detector Upgrade, and Audio Upgrade is $170. Is this correct?
I would consider doing this after my 1 yr warranty runs out if they actually improve real world performance.
Also, how long did the total process take from shipping the R-75 out, till it was back at your front door?
Thank you very much,
Lenny

1119. Hum-free computer speakers?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-15 19:28:20 UTC
From: Dave Ulrick
Topic: 1119 Message: 1119

Hi,

Some of you have mentioned that you have connected a pair of computer speakers to your R75. I've done this and it works fine, _but_ the "wall-wort" transformer for my speakers (Yamaha brand) puts out a good deal of hum. I can hear the hum behind some of the strong SW broadcast stations, such as HCJB at 9745 kHz (approximately 0400 UTC; my QTH is in north central Illinois). I know the speakers are the culprit because there's no hum if I unplug them and use a shielded hi-fi stereo speaker (one of the popular compact black metal speakers from Radio Shack) in their place. Therefore, I've moved the computer speakers to one of my computers and kept the passive speaker on the R75.

Recently, I've moved the computer which uses these speakers into the same room as the R75. Thankfully, my computer and monitor put out little if any RFI, but now the noisy transformer is back in the same room as the R75, humming just as before. Whether the computer and monitor are on or off, I hear the hum whenever the speakers' transformer is plugged into the wall; turning off the speakers without unplugging their transformer doesn't eliminate the hum.

I'm prepared to experiment with ferrite cores since I have some on hand, but if they don't solve the problem, could you recommend a make/model of computer speakers with a decent transformer that won't mess up my SW listening?

Thanks,
Dave

I have the Kiwa mods and yes to me it was well worth it.
The filter choices all make sense, the audio was greatly improved and the synch. mod helps the radio lock and provides some improvement in severe selective fading conditions. There is no great cure to the synch. problem, however with the mod. and the rf gain control coupled with if tuning there are some definate improvements.
I would say a week to ten days from what I have seen to get the radio done and back. Craig from KIWA is a genuine person who has an extensive engineering background and cares for each radio sent in as if it was his own.
I have a 80 foot longwire antenna fed to a mfj959c antenna tuner preamp via rg58 cable. I also have a discone fed to the tuner as well and a direct feed of the long-wire to the high z input for compairison purposes. The tuner is effective only from around 3mhz up, and I suspect it is because my wire is so short (reminds me of my first divorce but I digress). The preamp is absolutely non effective. In fact, it completely wipes out all reception. I suspect that the front end becomes overloaded with garbage.
The straight long wire in all cases is inferior to the tuner combination, even when the tuner is switched out. I think the matching of coax directly to the radio provides a better impedance to the 75. I also have a ground connection directly to a copper pipe that is grounding both the radio and the shield from the rg 58.
All of these items are available at universal radio or radio shack for not much cash.
Testing the 75 vs other radio this morning put it near the top if not the top. Performance on medium wave is superior to all with the exception of the sat. 800 which gets the edge due to audio and excellent synch. feature.
Shortwave performance tested receiving radio cultural in Guatemala City put the 75 in second place behind my icom ic-r8500 which surprised me greatly since the 8500 is touted as a vhf and uhf radio. The 75 seems better than all the rest of my radios including a jrc 535d.
I would be interested in hearing from the rest of you people who have tested the 75 vs other radios in your shack.
Finally the speaker problem, I use one of two speakers....either the cheap radio shack21-549b or the cheap rca40-5001 on sale at radio shack as well. The rca is a bit too base oriented for dx, but for program listening it can't be beat. I wish there was a mod. to allow for a.m. stereo reception...rado??? anyone?????
I too would love to spend a few min. reading your tests and antenna stories. I learned what I wanted to do antenna wise from this group and from various gentlemen met through e-bay (yes there are some nice people who sell there and care about radio like we do).

Please ramp up the posts guys its the weekend and I need something to do other than sugaring my own chalupa.....hahaha.
Phil

Gerry,

I used to do the SB modes also, with my older R-71A
(now sitting in storage, needing fixed-up). This was with
an Alden unit (a Bob Grove special clearance purchase).

I now have the R-75, and when I get a new computer system
(and get away from Windows 3.11), I just may try weather
fax imagery again, this time viewed on my 19" monitor.

:)

- Patrick.

From: gricer37
Topic: 1122 Message: 1122

At the moment i am using a wellbrook ala 1530 active loop connected to a icom ic-r75.Used to use a wire in the shack about 50ft long,it went around the celing.Scince getting the loop reception has greatly improved.

I use a T2FD (Terminated Tilted Folded Dipole) from RS Systems in the Netherlands. It is also available from Universal Radio for about US$250. It is a low noise (provided good earth) wideband antenna - the commercial article has virtually flat response from 3 to about 25MHz. Also it is quite short - 15 metres hung at an angle. If the commercial article seems a bit expensive then you can make one yourself; there are numerous articles on construction but perhaps the best is using the centre balun available from Wellbrook in the UK. With it you can have the most compact antenna possible. The balun costs about 25 UK Pounds. For more info see www.wellbrook.com/UMBT2FD. I find the antenna excellent in an urban situation with limited room and urban noise. It is not a particularly sensitive antenna but reveiver gain usually compensates even though I occasionally employ a low noise tuned preamp. Noise is the main enemy of urban & suburban DXers which is how the T2FD shines. Hope this has been of help. 73s Ian Johnson Brisbane, Australia Visit the Australian Radio DX Club site at www.ardxc.fl.net.au ----- Original Message ----- From: "handheld45" Date: Saturday, February 16, 2002 1:37 am Subject: [icomr75] Antenna poll... > > > > > I know people have posted about antennas before, but I would still > > like to see what type yall are using. Yes, beatiful antenna. Only advantage of the receive-only T2FD that I described is that it can be made quite a bit shorter - 17m (51.5') for an antenna which will work down to 3MHz. (25m [76'] for 2MHz). For those not interested in the tropical bands (below 6MHz) it can be shorter still. Also, the Wellbrook URL should have been www.wellbrook.uk.com/UMBT2FD.html Plenty of choices. 1127. Antenna Poll/T2FD/KAZ etc - ref: Lew Chapman

Yahoo group: icomr75 (2000 — 2002)

From: Ian Johnson
Topic: 1127 Message: 1127

Lew,

Your address bounces so here is your message and my reply via icomr75...

G'day Lew,

I think we would all be grateful for any antenna info'. No use having a good receiver with an ordinary antenna. Is your "end-fed inverted V" a KAZ?

Your KAZ sounds interesting. I have been following KAZ and Pennant antenna developments on the FlagAndPennant mail group for low frequency work. The whole subject of non-resonant directional loops has re-invigorated antenna design.

My problem is that I'm a bit of a vascillating gunna - I'm gunna put up one of these antennas one day if I can decide between KAZ, Pennant and EWE. That's three antenna types that readers may want to search the internet for.

73s
IanJ

From: forbes1136
Topic: 1128 Message: 1128

Hi all. I'm contemplating a purcahse of this receiver. Can anyone tell me how the scan performs in the HF mode? In other words, can I successfully scan and have the receiver stop when it hears a transmission on say, 11175?

I'm trying to find the most effevtive way to listen to these stations without having to sit in front of the reciever all evening or to have to "park" it on one station.

Can some folks give me feedback on whether this is possible? Or how do you use the receiver for the utility bands.

Thanks in advance.

Ed

it's a very good receiver for utilities-no doubt. but uf you want freedom
from sitting in front of your radio,
then by all means get a ten tec rx350. i am serious about this-check out
there sight and the rx 350. it's a better radio
than the r75 and works from the hand held remote control. so you don't have
to sit in front of radio while getting
listener's fatigue. the 350 also has 34 different filter choices and very
good 16-24 bit dsp technology.....QUIET.
i have a friend who owns both radio's and has them running off the same
coupler and the 350 wins everytime.
i am into utilities too. joe jackson my friends email:
rmonfeli@.... he has both radio's and has owned a ton of
radio's.

Joe - thanks - actually, I have an RX320, and the decision for another receiver is between the RX-350 and the R75! I was already leaning towards the 350, but of course the price of the R75 makes me want to be sure of the premium involved for the 350. Thanks for the input.

Get more than 1 radio. I listen to 11175 (GHFS) on my Icom; 11282 (ARINC) on my Drake and LA Center (ATC) on a scanner. Sometimes I'll hear the same "Reach" mission on all 3. The "scan" mode might work OK with a low noise antenna. I'll have to try some time.

Thanks for the input Dave. Yes, it looks like more than one radio is necessary for UTE or HF listening. Let me know how the scan works on HF if you try it.

1133. Theme: Radio raft and Interface

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-16 16:14:33 UTC
From: Zacharias Liangas
Topic: 1133 Message: 1133

Previous saturday i have received the full version of radio raft 3.21and the simple computer interface from Pervisell for this program.

It is my 3rd time systematic work on digital signals over HF as my first time was back to 1990-1 when i used the Philips S2935 and a Spectrum interface TIA for tuning to press agencies and more particularly the TANYUG which had very interesting international news.
And my second time was on 94 when i have bought the 462 directly from MFJ and used cnnected with the LC100 printer. Many logs have been made with it as well as letters sent to some stations mainly for CW and RTTY

MY third time was two years ago when i downloaded some amateur radio progreams such as Hamscope , MMTTY WXSAT and others.
I also tried to use RRaft. Together with a friend , an electonic techniciamn, we made the cicruit shown inth e page of RAft ,but afterwards it has been abandoned for much time .
two months ago i finished it but the circuit for unknown reasons did not wirked . For this reason i prefered to buy a news one from Pervisell.

Here is a little from what i found (such as preliminary)
The program seems to work very good under DOS and still under Windows in my pentium III on 800 MHz. However under Windows RAFT can be used ONLY foreground otherwise all system sources are occupied . Usage of interface inhibits any noise to go to receiver, as it would be done otherewise with audiocard (about 10 db)

INstead of making a overview i will only epxlain my prso and cons:

Points I liked:
-The big number of modulations it can decode and the realatively fast aboility to identify the modes inless than 10 seconds
-The ability to view status informatiom (idling , repetition) and corecting text if a backspace s transmitted
-The similarity of using the keyboard as happened with the SPECTRUM program / interface
-The time rows and the ability to save also the times
-The baudmeter and the digit modes (and save the 'raw data')
-The automatic bit inversion (works also when you change the sideband from upper to lower!)

Points i did not like
- The high sourced the program requires under Windows
- The difficulty to decode signals close to threshold. True TTY under Win can decode them better
- The relative difficulty to decode CW signals
- Did not found so far a ny manual UOS operation

- the inability to decode CIS peudo-baudot signals There are too many signals in muy area
- The low size of buffer (only 64 kb??)

Programs i used so far under windows are: MMTTY , HAMSCOPE , True TTY , Sea TTY The last two programs are best for TTY as they can decode signals that are a just above the threshold.(noise level)

I could prefer a program that could use the interface , be under, say WIndows , have the ability of HAmscope to show audio above noise, have all the automoatic operations of Raft including the time in saving higher buffer and decode so perfect as the True TTY does.
This does ot mean that io do not like the Raft!When my computer is OFF i can switch at half time to use RAft than any other program under WIN.

Here is a list logs i decoeded the previous 2 days . Tewxt as logged in notices paper no corections

1134. Scanning Utes

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-16 22:11:15 UTC
From: Urban Larsson
Topic: 1128 Message: 1134

> Can anyone tell me how the scan performs in the HF mode?

It can do the scan in several ways. I use squelch controlled scan.
It works excellent! I didn't know that scan could work that good in HF.

The R75 stops on the frequency (in search mode) or channel
(in scan mode) for 10 sec when the squelch breaks, so you'll have
to stop the scan action manually to be able to listen to the action
more than 10 sec. Otherwise the R75 will continue to scan. The scan
speed is quite high and you can easily scan 50 ch without missing
to much of the beginning of the transmissions.

The only flaw with the R75 I suppose must be the AM sync. But that's
only for broadcast reception and you're probably more like me and
mostly monitor the interesting military and rescue frequencies where
all the action is?

Ubbe

1135. Re: [icomr75] My Stock Filter & Option Settings For AM Broadcast Listening Using ECSS (USB / LSB / CW-REV / RTTY-REV)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-16 08:59:26 UTC
From: pjrohio@ntr.net
Topic: 1107 Message: 1135

Hi All,

Some updates on the CW, CW-REV, and RTTY-REV modes
for ECSS operation.

I changed the "CW Pitch" to '45' and the "TON" to '2125'
to reflect clarity of audio with PBT knobs at center,
for a starting point.

(Example: When in "CW" or "CW REV" [W]ide mode, the longer,
inner PBT knob can be turn either direction for a
'bass/treble' effect to your liking (similar operation in
USB/LSB mode).

If your R75 is setup like mine (as in my previous message
post, and the 'new' updated changes I mention here),
then try this:

[] Select an AM signal (local AM station or shortwave).
[] Go to "CW REV" mode.
[] Use [W]ide Filter mode.
[] Turn inner PBT knob fully clockwise.
(Audio should sound 'muddy', no high frequencies.)
[] Set 'Tuning Step' [TS] button to 1Hz mode
(See bottom of page 12 in manual if you need info).
[] Zero-beat signal. (You should end up almost, if not
exactly, at +450Hz.)
[] Return PBT control to center.

Example: WTAM 1100 AM Cleveland should end up
reading on the display as...

[W] [REV] CW
1.100.450

Now, turn the inner PBT counterclockwise, at about
one-and-a-half marks. This is my 'Megaphone' setting.

:)

For RTTY-Rev, the readout would be:

[W] [REV] RTTY
1.102.550

For CW (-450Hz), the readout would be:

[W] CW
1.199.550

Updated Info:

SAM SW = SA or En ("En" when surfing in S-AM mode.) [See "S-AM"
below.]
*b CW PITCh = 45 (450Hz)
*c TON = 2125 Hz (RTTY Mark Frequency - For RTTY-Reverse)
*c SFT = 425 Hz (RTTY Shift Width - For RTTY-Reverse)

*b *c ('Starting' values for PBT controls at center, unless "*c")

*c If need to shift further:

Select any of the 3 optional frequencies as needed to shift away
from interference when using RTTY-Rev (not RTTY) or
CW / CW-Rev ECSS listening.

Rado,

"...there is a simple workaround for the problem. Turn
off the AGC and adjust the RF gain manually."

Yes, that will work, provided I'm at the radio. But for 'hands-off'
monitoring and/or unattended recordings, Automatic Gain Control
is a must. (Unless the the signal would never vary. True most of
the time for local AM, and somewhat for daytime shortwave,
but at night?)

From: pjrohio@ntr.net
Topic: 1107 Message: 1139

" ...some people on here have praised the 3.3 kHz filter for ECSS: it
is however an expensive filter. "

phil,

I'm looking to perhaps get a filter. But if there is a mod
for the 'mixing problem' of the 15 and 6 filters with the EXPansion
turned on, then I may not need optional filter(s)?

" ...one trick i do is use AM mode narrow (with dual 2.4 kHz filters)
but decenter 1.2 kHz (either way) from the original frequency.
The result is louder than ECSS and the frequency response
appears different on a scope. "

Yes, I do that, also. See my other post on how I also do that via
CW, CW-REV, and RTTY-REV. It's my 'MegaPhone' setting. :D

On the AGC-off/RF combo:

Ah, but for me, AGC-on is a must for unattended, hands-off recordings or
just monitoring near but not at the radio. Especially for night
shortwave signals, and even some 'local' AM. There times when I
miss the slower time constant of the R71A. :((...sniffffffffle)

" ...the R-75 is very stable 'as is'... "

Not that stable with ECSS. The slightest drift from the initial
zero-beat, I can hear the audible difference. This is noticed
even as little as a 1-to-2 degree room temperature change.

This is also desired for unattended recordings.

So, I'm still open to get the... (insert big fanfare music here)

H i g h S t a b i l i t y C r y s t a l U n i t!

(Echo-echo-echo...)

(Sprinkles/Glitter/Flash/Boom-Bang!)

Price lowered to sell: ICOM R-75/DSP receiver about two months old with KIWA mods; Icom 2.8 filter on the 9Mhz board and Inrad 1.8 on the 450 board. Have bought a new rig with general coverage and am not using R75 as much as I expected. I like the rig better than the Drake R8B tho - it's a GREAT rig with the mod!Most of you looking at this will know the cost of the Kiwa mods etc so...I'm asking $750 plus shipping. Thanks for reading.

1141. Re: Scanning Utes

Topic: 1128 Message: 1141

hi Ed:

just passing on what i've read...

(+) the RX-350 has a better synch detector, more memories, 34 filter settings, and a bandscope.

(-) the buttons are small, the display is dotty and ghosts when tuning quickly, the unit has low ultimate selectivity, FM is distorted (due to max bandwidth), and longwave contains BCB images.

there are other problems relating to the synch losing lock as well as with the RF gain, noise reducer, blanker, autonotch; however, it is expected that software upgrades will evenually/has fix these.

the tentec RX-350 is over twice the cost of an R-75, with no keypad. i would ask someone who has an RX-320 and RX-350 if it was worth it. you may want to also look into a program called Smart ICOM Control. the R-75 is like the RX-350, very software controllable.

phil :)

Just curious, why do you think that you'll need to upgrade the filters? Everyone seems to have their own personal favourites to put into the R75. Have Icom made a bad choice when it comes to filter selections?

The DSP isn't that wonderful. It makes a good job of notching out heterodyne tones but the noise filtering is terrible. It drops the audio level to about half and with noisy signals it garbles the voices to be more digital and makes it really hard to understand what is said. It works better with signals that are only slightly noisy, so the use of the DSP only works ok with strong BC stations when you want to filter out the last bit of any background noise.

Ubbe.

Ubee:

> Have Icom made a bad choice when it comes
> to filter selections?

the stock filters were not a bad choice by ICOM. on AM you have a
nice wide 6.0 kHz... on SSB you can do from 1 to 2.4 kHz via the PBTs.

> It
> drops the audio level to about half and with noisy signals
> it garbles the voices to be more digital and makes it really

the DSP NR works very well at my QTH, i have spectral plots showing
that the amount it drops the audio level is very low unless you're
turning it up too high. settings of 3-5 work best.

phil :)

phil :),

Well, within several or so Hz, depending mode/filter selection,
with headphones. :)

Without headphones, depending on mode/filter selection, around 10-15 Hz.

I also have the Sangean ATS-909. It has 40Hz tuning resolution in
Side Band. ECSS listening on this unit can make you ill.

;)

> i am going to go check out your RTTY-REV tip... :D

Ya know, the more I played around with the CW/CW-REV/RTTY-REV
modes for ECSS, tonight, the more I like it. Especially
since the recent tweak I made to it.

It adds a nice 'MegaPhone' punch to the to the 'talk' programs.

I have use this before, but somewhere along the way I just
ended up using mainly the USB/LSB modes.

I think the 'MegaPhone' method helps better on the weaker
and noisier signals, too.

We must have different DSP's then. Mine is the UT-106.

As soon as I enable NR the audiolevel drops to half
regardless if I have setting 1 or 7. The setting are only
affecting the amount of noise supression, and increased
distorsion to the audio quality, and not the actual
audiolevel, at least not with my DSP. The DSP module have
been poorly designed to fit the R75 needs for input/output
level at the DSP connector. Please tell me what DSP you use?

So there's no need to change anything yourself?
How can you tell if you will gain anything by
getting other filters? Trial & error? It will
soon add up to be a very expensive way to do it.

From: Lew Chapman
Topic: 1151 Message: 1151

Greetings from Moana Beach South Australia. I would like to put in my 2 bobs worth. I feel that it's great to discuss all mods & additions available to the r75 as has been the case with many great sets over the years & ofcourse it is only human to tinker and try to improve. But if you only have a wet string attatched to the Antenna imput then no degree of fiddling will help the set.
In regard to interferance from computers, power sources etc can be at least greatly reduced by a coaxual feed line, rather than just antenna wire into the set. I do a fair ammount of SSTV work, and so the computer is along side R75, I suffer no noticable interference. This is probably largly due to a combination of a well shielded computer, and set as well ofcourse. You all may be interested in pics i have posted in the pictures section. I would like to discuss Beverages. loops, Squashed Deltas, Inverted V's etc if any one is interested.
Cheers Lew Chapman

Well, regardless of Joe Jackson's post which might have been better directed to alt.advocacy.radio.tentec, let me answer the question you actually ASKED.

The R-75's scanner works very well. There are 3 basic scan modes plus a priority override. The basic scan modes can be made to behave differently depending on how you set the squelch and scan/resume mode. Scanning preprogrammed memory locations would probably be the most familiar to you if you have ever used a standard "police" scanner.

I'm sure the RX-350 is a wonderful radio. But I don't think this is the right group to be discussing it. I'd hate to see this group and the RX-350 group become less effective because advocates began posting "your radio sucks" back and forth.

1153. Cool uses for your R75

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-18 16:03:09 UTC
From: Dave Ulrick
Topic: 1153 Message: 1153

Greetings!

It's occurred to me that it might be interesting if we share a bit about cool things that we're doing with our R75s. Since I came up with the idea, I guess I'll start the ball rolling.

As I'm sure you all know, the R75 can be operated by a PC connected to the radio via a serial cable. I've gotten myself a cable (CompUSA labeled it as a "serial mouse extension cable") and installed Smart Icom Control 32 on my Windows 2000 PC. I've also run an audio cable from the R75's tape out jack to the sound card's aux input jack. Since my Windows PC is just a few feet away from my R75, the main thing that's useful about this setup is that if I fire up RTTY software such as MMTTY, I can tune the radio and watch the RTTY QSOs scroll by without leaving my seat. This is all moderately cool as far as it goes, but I've managed to make it even cooler.

In my house, the R75, the Windows 2000 PC, and my stereo system live downstairs, whereas my Linux PC lives upstairs (it's been banished to its own room because of its rather loud exhaust and intake fans). Recently, I had an network/audio/video connection run between upstairs and downstairs. This has allowed me to network my PCs and exchange audio between my stereo system and my upstairs PC. My most frequent use of this setup is to play MP3s on my Linux PC with the sound coming over my stereo system. However, now I've set up something just as cool: remote control _and_ remote listening with the R75. Thanks to free software named VNC, I can display an image of my Windows 2000 desktop on my Linux PC. If I fire up Smart Icom Control 32 on Windows 2000, I can control it from my Linux system. This allows me to control my R75 from upstairs and also hear its audio. Actually, I can hear the R75's audio (or my MP3s) throughout the house if I wish, thanks to a low-power FM transmitter I have connected to the Linux PC's sound card.

If you're interested in setting up something like this, here's a few more tidbits:

1. Whenever you feed audio from one room to another, beware of ground loops. They can be a prime source of humming noise in the background of the audio. The worst ground loop I had--audible at normal listening levels--was solved by installing an antenna isolation transformer on my cable TV feed. Even after much experimenting, I still have some hum that's audible on my stereo receiver, but I have to crank the volume up far higher than normal listening levels to hear it, so I can live with it.

2. The R75 sends the beep tones generated by button presses out via the tape out jack unless you use the SET menu to entirely turn off beeping. The beep level setting doesn't affect the tape out jack.

3. Smart Icom Control 32 lets you turn off AGC, but it provides no way to control the RF gain. I assume that this is because Icom provided no interface for remotely controlling RF gain. If so, bummer. :-(

4. I found that tuning with Smart Icom Control 32 is very slow if I configure it with the recommended command timeout of 60 seconds, but it's quite a bit more responsive if I set the timeout to, say, 20 seconds. A timeout that's too small may cause weird behavior such as the R75 being unexpectedly turned off.

5. Thankfully, the R75 seems to be relatively immune to computer-generated EMI/RFI, at least below 30 mHz. My recent problem with a computer speaker transformer generating audible hum in the 31 meter band was solved by wrapping the speaker end of the transformer's DC power cord around a ferrite core.

6. The output of the sound card in my Windows 2000 PC is rather noisy, featuring not only hum but also a persistent high-frequency tone, so I decided to connect the R75's audio directly to my upstairs/downstairs link. A Y adapter from Radio Shack allows me to connect the R75 to both this link and the Windows 2000 PC's sound card.

OK, there's my contribution. What cool things are you doing with _your_ R75?

Dave

> As soon as I enable NR the audiolevel drops to half
> regardless if I have setting 1 or 7.

there is a drop in audio but it is very minimal. i have confirmed this with spectral plots that will eventually be up on my site. i tested at OFF, ON, +5, +10, +15... the plots were then superimposed; the result: OFF, ON, +5 sit on top of one another. somewhere between +5 and +10 there is a drop in audio and +15 sits very close to the +10 line. if yours is not working the same that stinks... i use the NR all the time, it's excellent.

Greetings Dave!

i downloaded Smart ICOM Control but have not used it yet. i use my laptop PC to decode SSTV, RTTY, BPSK31, and CW. i may write some control programs eventually but am not interested in re-inventing the wheel. i made a simple GUI program to turn the unit ON/OFF and change the frequency just to see what is involved. i like to program using VC++, BCB, and MASM.

> I assume that this is because Icom
> provided no interface for remotely controlling RF gain.

command 14, subcommand 2 is the RF level setting :) three cheers for ICOM! they made the unit so CPU controllable: i have tested both this and the AF control.

phil :)

The gain reduction of my DSP is something like 5 dB with a setting of 2 and around 10 dB with a setting of 5!

Then it's even worse than I expected! 5dB is close to 6dB
that is half the volume measured in voltage, but 10dB is
really bad! Thanks for the info Gert.

Ubbe.

According to me. The R75 cannot be fixed, I've checked the schematics. It's the DSP level out that needs a fix, and I have been unable to find any schematic for the UT-106 and it looks to be too much work trying to reverse engineer the DSP. Poorly designed by Icom when they don't interface it properly into the R75. And there could only be a UT-106 fitted to that particular module connectors? Shame on you Icom!

Ubbe.

i am not advocating any radio-no one radio is perfect. i had an r75-didn't install the dsp nor any fancy filters.
the r75 did a good job. it is priced right without the add on's. as far as ten tec goes maybe they did throw some knobs
on the 320 and call it a 350. i guess they do that with the 340 too. all i was saying is on 140ft long wire with a stridsdberg coupler'
the 350 picks up the frequency clearly and quiet compared to a fully equipped r75. the 350 drags signals out of the mud much better.
you can hear what is being transmitted better with the tougher signals.
nothing against the r75....it's a nice radio.

1162. Re: Scanning Utes

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-19 15:17:50 UTC
From: forbes1136
Topic: 1128 Message: 1162

Thanks to all for their feedback. And I agree - I did not want to take away from the focus of the group. My concern is that with all of the background "noise" associated with some HF utes (e.g. 11175, etc.) is t hat the scanning function will not work properly. And that's important to me in the consideration of a new purchase.

The R75 has such great reviews from everyone, but few people seem to use the scanning feature for Utes. To me, this should be one of the most-used features - and this is an indication to me that using the scan feature for utes is problematic. I am puzzled by this.

Any comments are appreciated.

Ed

I sometimes scan with my R75, usually 5.68MHz and 11.175MHz both USB.

I find that there is a difference between the squelch level at which
audio gets through and the level at which the scan stops.

In other words, if I have the squelch set too low then I get a "ticking"
noise each time around the (not stopped yet) scan as a little background
noise gets through. If I turn the squelch up a little then the ticking
goes away but then I miss some of the weaker signals that I would have
caught if I'd been sitting on that channel (not scanning) with the
squelch at the slightly lower level.

So, I think there is an issue with the R75's scanning at least on my
unit, but a very small one as there is a workaround if you don't mind
setting the squelch a little higher.

Having said all that, scanning on the R75 is *much* easier than on my
AR7030+ as the front panel squelch control is always there compared
with the one on the AR7030+ being umpteen button presses away and then
it forgets that it is enabled every time I switch off (or standby).

Cheers,

Mark.

I'm glad to hear that RF and AF gain can be remotely controlled. As
far as I can tell, Smart ICOM Control doesn't provide remote control
of those functions. It does let you turn AGC off, but that's not very
useful unless you can adjust RF gain as well. Is there any other
remote control software for the R75 which provides support for RF
gain?

All,

Actually, the reason why I hadn't added any "knob" controls was because I hadn't any good knob components to use in the interface.... that is, until now (rows of sliders just don't cut it for those things, IMHO).

I understand. I agree that a bunch of sliders isn't the best. The
PBT sliders work fine, though.

Please be sure to let us know if/when you have a chance to add the RF
and/or AF gain "knobs". Another thing that I think would be cool is
if you could tune the R75 with the scroll wheel on a wheel mouse.

Although I've only played with it for a few days, Smart ICOM Control
32 looks like a fine program. Keep up the good work!!!

Hi Ed and Group,

When you are trying to monitor HF UTE in general , you can't really scan in the true meaning because if you try to set the squelch so you can scan or search you miss most of the Comms, they come in at the squelch level most of the time. I have had success with both units scanning by leaving the squelch open all the time and set the dwell time low and let it go from one freq to another and when there is comms stop the scanning and listen, this is much more effective with a quiet receiver.

I have to agree 100% with this statement. I find scanning HF utes is nearly useless (much to my disappointment.) The squelch has to be set so high to overcome the inherent noise level (atmospheric or local generated noise) that only the strongest stations break the squelch. What usually happens is that I will hear Andrews or CAMSLANT return a call and then I will lock onto that freq., turn down the squelch, listen and then resume the scan. I don't know any way around this. I wish there was a way to scan with the squelch open, but on the R-75 it will lock on each freq. for about 10 seconds before resuming.

Regards,
Bob

You should use a cable that's wired like a modem cable (DCE-DTE)
rather than a nullmodem.

I'm using a cable that was labeled as a serial mouse extension cable.
My local computer stores didn't seem to carry anything that was more
appropriate.

In order to fit the cable on the R75's serial connector, I had to
unscrew the hex-shaped metal things on the end of the extension cable
that are intended to accept the end of the serial mouse cable.
Although this leaves me with no way to permanently fasten the cable to
the R75, my cable stays in place by friction.

My local computer stores didn't seem to carry anything that was more
appropriate.

In order to fit the cable on the R75's serial connector, I had to
unscrew the hex-shaped metal things on the end of the extension cable
that are intended to accept the end of the serial mouse cable.
Although this leaves me with no way to permanently fasten the cable to
the R75, my cable stays in place by friction.

> Thanks
>
> Antoine (France)

I hope this helps.

Dave

I have to agree 100% with this statement. I find
scanning HF utes is nearly useless (much to my
disappointment.) The squelch has to be set so high to
overcome the inherent noise level (atmospheric or
local generated noise) that only the strongest
stations break the squelch. What usually happens is
that I will hear Andrews or CAMSLANT return a call and
then I will lock onto that freq., turn down the
squelch, listen and then resume the scan. I don't know
any way around this. I wish there was a way to scan
with the squelch open, but on the R-75 it will lock on
each freq. for about 10 seconds before resuming.

Regards,
Bob

I'll have to take a closer look at the cable. If I remember right,
the threads for the hex dealies were embedded in the molded plastic
cable end.

Thanks Mark - just the kind of feedback I was looking for. I don't believe there is a problem with your unit - this is just the kind of thing I was told to look out for when trying to scan HF - it's very tough to do. But it seems that the R75 is capable of scanning these frequencies, just with a little compromise.

Mark:

i have not used your program yet with my R-75. i did download it though before i got the unit so i could get a feel for what was controllable on the R-75 and your program's features. your program is very nice and i am recommending it on my future website. IMO if you make a big slider control this would not be a bad alternative to a knob.

phil :)

Actually, I prefer using knobs because sliders take up way too much real estate. I've used sliders before (for the PBTs on SIC and for a couple of other controls on Smart NRD) and they don't do it for me. For one, it takes the "radio" feel away from the interface. I liked sliders on my ICF-2001, but these are real radios. <G>

Hi Phil. I don't have one yet - I'm trying to decide which new receiver to buy and it's down to the R75 and one other. What I want to do, to simplify for this message, is to scan between two frequencies in HF SSB, and have the receiver stop when it hears a transmission, listen for a period of time, or until it completes, and then move on up the band until it hears another transmission, and repeats the process.

Much like the Uniden and RS police scanners that manny of us have.

I know it will do this on the SW bands...the trick is, due to all of the noise on HF SSB, to do it on these Ute frequencies.

Actually, the knobs I've already designed work on a right-mouse = cw,
left-mouse = ccw basis. That allows you to hold the mouse button down for
rapid-fire tuning, etc.

hi Antoine:

> now i try to use VBasic , i send "FEFE5AE01800FD" to switch on

i believe 'ON' is FE, FE, 5A, E0, 18, 01, FD

use '01' instead of '00'

also realize that each set of two numbers above represents /one/ byte
because they are hexidecimal numbers therefore 'FE' will probably
have to be sent out of visual basic (i am a VC++, BCB, MASM user,
little rusty on BASIC) as CHR$(254). you can probably tell VB they
are hex numbers also with a prefix of some type.

if you need more help just ask.
phil :)

Actually, the knobs I've already designed work on a right-mouse = cw,
left-mouse = ccw basis. That allows you to hold the mouse button down for
rapid-fire tuning, etc.

Haven't added the knobs to the new Smart Control Pro yet, but a preview is at:
http://www.fineware-swl.com/src4.html

Right now I'm calling it the new Smart "R8" Control, but the whole thing will be modular and will "morph" to whatever radio it's going to be used for (IOW: finally one product for many radios). This picture just has the R8 faceplate showing and not the JRC, Kenwood or Icom ones yet. I'm not going to shout too loud about it, but look real close at the lower picture.

I know of no improved and better "A" models as of yet.

I have seen this used by radio dealers as a marketing gimmick to make their models stand out. Give them a call and ask. We would all be interested to know.

Another reason for the "A" suffix may be that there are two different power (Mains) supplies for the R-75 (115 and 220Vac) but this is external to the R-75.

Icom usually debuts their new models at Dayton Ohio's Hamvention in May. Waiting to see what is in store for us this year.

My R75 is really a an IC-R75E. I'm guessing that the E stands
for Europe as I'm in the UK. Maybe something to do with different
safety and/or emissions standards in different regions?

Cheers,

Mark.

The letter is indeed a country/region code. The -E probably has
a 9 kHz step unavailable here. There are others that don't go above
either 25 or 30 MHz. The -A is just a North American designation,
not a designation for an "improved" version.

1201. Curing Computer Noise in Radios - PART TWO

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-21 20:43:37 UTC
From: AutoTest
Topic: 1201 Message: 1201

In Part One I went into a great amount of detail in describing how to stop the RF generated inside the computer from leaking out. If you now have a computer case that does leak RF then the only way out is via the connections to that case.

RF can leak via the mains cable into the house wiring to be re-radiated and picked up by your super sensitive receiving antenna and back to the receiver. Use a filtered power board, as I described earlier, and keep the lead as short as possible.

*** Modems

The telephone line from an internal/external modem can act in the same way, with the RF being re-radiated from the overhead lines entering your house. Use a large clamp-on split ferrite suppressor and wind the telephone line through it at least 6-7 times.

For an external modem, use a shielded modem cable which has the shield connected to the shells of the plugs either end. Ensure that the plug shells makes good contact with the port connectors on the computer and the modem. If there is still a problem, then RF may be using this route back through the modem's power supply to the mains supply. Put ferrite suppressors on each end of the modem cable connecting the modem to the computer. Two turns either end would be good. Additionally put ferrite suppressors on the power cable

*** Keyboard & Mouse

The keyboard socket is usually mounted on the main PCB of the computer and does not often make contact with the metal case, but it should be grounded nearby to the case via a metal stand off. If a nylon stand off has been installed replace it with a metal one.

The keyboard cable may already have a ferrite suppressor built into the cable. However this is only a single turn, add another one with at least two turns.

The keyboard itself has its own microcontroller fitted to its circuit board. On this board there should be some chokes (about three in series with the cable). Cheaper keyboards may have wire links where these chokes should be. You can replace the links with 1mH chokes. If the keyboard is a real problem get a new one.

Mouse cables should be wound through a ferrite suppressor, 6-7 turns at the computer end

*** Serial, Parallel and other ports

Use high quality shielded cables between devices and ensure the connection of the plug and shell is electrically good. If, like a serial cable there are securing bolts that screw into the nuts on the ports, then use them to maintain and add to the connectivity.

If there are still problems, then you should try ferrite suppressors or toroids at each end of the connection.

If cables run long distances try to keep them away from other sources of interference.

*** Sound cards and Multimedia Speakers

The line input, line output, microphone and the amplified speakers make be a source of interference. Winding each cable through ferrite suppressors or small ferrite rings will help eliminate the problem. Try the speakers without power or use the same methods on the DC cable from the plug pack.

*** The Monitor

WARNING - Messing about inside monitors can be extremely dangerous to your health. I personally would not touch the inside of a monitor with a very long insulated wooden pole. Some shielding can be done on the inside, BY PROFESSIONALS, so trying it yourself is not worth the risk.

However, there are a number of things that can be done that will probably eliminate your problems.

The position of the monitor in relation to a radio and its antenna input/outputs and power supply can make a difference. Try routing these items in from a direction opposite to where the monitor is. In my own case I use a Dual Head video board, so there are two monitors next to each other and within 15 inches of the radios. My antenna leads come from a direction behind the monitors. I found I had to run them a floor level past my position for a couple of feet and then up and back to the radios.

If your monitor is sitting on top of your computer case, then try lifting it up off the case with an insulating material (wooden board). You may need to get as gap as much as 150mm (6 inches) and in this case you may be better moving the computer on to the floor or somewhere else. If that is not possible you can try a metal shield between the monitor and the computer. Use metal fly screen, expanded aluminium or even a large metal plate. This needs to be connected by a lead to the monitor chassis. You could get your local TV repair shop to bring a lead out for you or another way is connect it to the braid of the video cable, but you will need to be very careful not to damaged the cable doing this. At the worst you can shield the monitor on the rear, sides, top and bottom. These shields are connected together and to the chassis as described above.

Try plugging your monitor into the filtered power supply board being used by your computer and wind the mains cable through a ferrite suppressor as many time as possible at the monitor end.

Check the mains input (IEC) connector of the monitor, hopefully it will be the filtered type. If it is just about 25mm (1 inch) long (front to back) then it is not filtered. It could be that the filtering is on the power supply and the only way to know for sure, is to have a monitor repair shop check it out. The (IEC) connector on the monitor is the plug and it is the socket that fits into it. I have recently seen filtered types of these sockets being available. If they are available in your country you could always try these.

The video cable and any extensions should be high quality and shielded. Nowadays it is not possible to disconnect the cable from the monitor, so we are stuck with what we have. Put a clamp-on ferrite suppressor on the computer end of the cable and wind the cable, at the monitor end, through a ferrite suppressor ring.

As the video cable is not very flexible you will need a large ring and you need to get as many turns as you can, but not for more than three quarters of the ring. The type of ring you can use are the split ferrite yolk rings which come of scrapped TVs or video monitors.

Get them from your friendly TV/Monitor repair shop. Unless you are 150% sure of what you are doing, do not try to recover these yourself, as the residual electrical charge in the TV/Monitor is dangerous and the risk of the tube imploding is high.

***

All of the measures described can be done by trial and error, easy ones first and working up from there.

*** Notes

As an explanation of how to wind cables on rings. You need to ensure that the parts of the cable not on the ring do not come together as your work can be undone by the RFI passing from the protected to the unprotected side. This is why I talk about only winding for three-quarters of the ring. There is a better way to wind the cable, but hard to describe. Start the winding and go half way, then go through and over the ring back to the start and continue to wind until you meet up where you crossed over. The cable will now enter and exit on opposite sides of the ring.

It is possible to remove the RFI from computer equipment to a level that is not noticeable. My own shack has 4 computers, 5 monitors, printers, scanners etc.

Well I think I covered everything, good luck. If I missed anything or you need greater detail get back to me

Regards and good listening

Antoine,

For VB you need something like this (CommPort can be 1 or 2 or 3 etc.)

MSComm1.CommPort = 3
MSComm1.Settings = "19200,N,8,2"
MSComm1.PortOpen = True

Preamble = Chr$(&HFE) + Chr$(&HFE) + Chr$(&H5A) + Chr$(&HE0)
EOM = Chr$(&HFD)

DataString = Preamble + Chr$(&H7) + EOM

MSComm1.Output = DataString

1203. R75 and Fineware software

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-02-21 21:40:38 UTC
From: cyr999@extremezone.com
Topic: 1203 Message: 1203

Hi folks -

I've had my R75/Kiwa mods up for sale but after looking at the Fineware software site I may very likely not sell it. It looks like the software could REALLY make listening and exploring for the casual user - easier. I was going to sell the R75 because I have a 756PRO with general coverage now - anybody know if the software will work with the pro? If it won't I think I may keep the R75.

Also, is the cable described at the website different then the cable used for connecting from the rig to Icoms software?

Finally, I use a laptop with a Belkin USB to serial port adapter and Windows XP - anybody use this adapter and have a problem with the Fineware software?

Thanks folks.

Just set the address to the what the 756Pro is set at. Most of the functions work. If you look at the C-IV commands set, commands like frequency control and mode are the same no matter what radio. I've used IC-746 and 718 control software to control my R-75 and 746 and vice versa. Not optimal, but you can make your 746 look like you are operating a 756Pro, at least the basic functions.
Personally, I would keep that R-75 along with the 756Pro. I have a 746 and an R-75 and use both a lot.

Hi Roy -

I think I WILL go ahead and keep the R75....presuming the software works well. The software looks like it would give a whole new perspective on that end of the hobby. Pure Hams have an awful lot to learn about SWL - and this software might take some of the frustration out of it! Thanks for the feedback.

Were you able to just plug in the Rat Shack suggested cable and go? Or did you have to do some pin reassigning - this may be a lame question because I am at work and do not have the rig or manual infront of me! 73/Tim

A plain serial cable (not rewired or null modem) will do. However, I
have no idea how you'll fare with a USB port and a USB/serial adapter.

Hello Tim,
It isn't even a Rat Shack cable, just the cheapest DB-9M to DB-9F cable I could find or scrounge up. The only thing that is essential is that is pin-to-pin straight through, that is pin 1 of the female side goes to pin 1 of the male side, pin 2 to pin 2, etc. Even the cheapest serial cables tend to be shielded since they are pretty much commodity items nowadays so you shouldn't have any problems there. If you have a C-IV cable, that would work also. I made one up one evening to control my 746 and it also works with the R-75. I wish Icom put a real RS-232 interface in all their transceivers.

Try it out, it's a lot of fun,
73
Roy

Better than what? If you meant Smart Icom Control, you obviously didn't
take a close look at that program's features.

I've just got myself a new R75 and I'm still learning to drive it -
the only receiver I've ever had to go to straight to the manual for.

W3JY left the following review on the eham.net site. Given everything
that has been said about the SAM function, what can people say about
W3JY's comments?

"As a SWL rig, I like the R75. The speaker is not the best for SWBC,
and a larger one is on my agenda. However, the synchronous AM works
FB--I don't know why the others complain about it! There are two
"modes" for AMS, one "automatic" the other "manual". It may be they
are leaving it in "automatic" and it isn't kicking in. However, it
makes weak, fading SWBC into a stable, pleasant-to-listen-to signal. I
leave the AMS mode on always... "

I always used it on manual; it never did much.
Dropping the RF Gain helped a lot more, obviaitng the
need for the AGC. With the AGC fix, everything works
a whole better. I can't speak for the results of the
other fellow.

I'm new to this; I've had my R-75 for about a month. I've learned a lot about S-AM on this forum. I did indeed find that dropping the RF gain greatly reduced the fading distortion, but it did the same thing on "normal" AM. So it's still not clear the S-AM does anything. SSB works very well, though. So I'm going to get the FL-257 filter. Too bad it costs more than a third what I paid for the radio.

From an antenna perspective, this thing is so sensitive it seems just about anything will work as long as it's outside. Unless you want something steerable to reduce QRM. Any opinions?

Greetings fellow SWL's,
Found this group in my quest for info on the R-75 and judging by what I've read I'm in the right place. Been in the hobby for a couple of years now and enjoy it as time allows. My main radio is a Drake SW-2 and a 40ft random wire in the attic. A recent move has boosted my interest as I now have room for a "real" antenna so it may be an Alpha-Delta sloper or l-o-n-g inverted-L. I'm also considering a radio upgrade and I like what I've read re:the R-75. It has more features that I think would enhance reception of faint signals. Although there seems to be some question about the usefullness of the S-am on the R-75 (Syncronous detection is pretty good on the Drake). What do you think; is the R-75 a significant upgrade from my SW-2? If so, there's gonna be minty SW-2 for sale.

In my shag I move around a lot. Two keyboards to operate, a scanner, the Icom, etc. So while I'm swirling around on my chair (one with wheels) I seem to pick up much static current. Whenever I touch the Icom (or the scanner) the sparks are flying between my fingers and the metalic rigs. And that's not pleasant to say the least. I'm sure the cause is a lack of earthing of the rigs.

Sometimes when I only briefly touch the dialingknob, not dialing it, the frequency skips a few Hz's.

1. Can this be damaging for the Icom?

2. Except for slamming some earthingrod in the garden, can I do something about this annoying sparks?

Maybe touching the radiator of the central heating before touching the Icom... :-)

Thnx a lot...

Grounding the rigs won't help that problem. You are generating static electricity and it would discharge to any metal object. You may want to ground them for other reasons, but that's outside the scope of your problem.

> Maybe touching the radiator of the central heating before touching the Icom... :-)

That, indeed would help.

I also create a huge amount of static -- enough to throw inch-long sparks from my fingers. Don't know why but it is probably my choice of clothing and shoes -- and the excessively dry Colorado climate.

To avoid the annoying "pain" from the sparks I often touch things (like door knobs, etc) with a key that I'm holding firmly in my fingers. This spreads out the point where the dissipation occurs for my fingers.

For protecting my equipment I have anti-static mats designed to be used with PC keyboards. I touch those first. Those are indeed grounded/earthed to a safety ground. In the US, every outlet plate is held on by a grounded screw. Similarly, I have the metal components of my desk tied to the safety ground via a 10 megohm resistor.

I got two at a hamfest for $1 each and had my employer buy one for at work which cost them all of $20. Check a computer supply house for a source.

Hi Curt,

I went along the same path you are (or may.) I used a SW-2 for several years and upgraded to the R-75 and never looked back. The R-75 opens up many new possibilties. It has many controls to tweak reception, more filter selections, outstanding display, capability to switch between two antennas at the push of a button, line out so you can decode digital signals, etc, etc, etc. As far as the sync detector, yes it is inferior to the Drake. But, I don't use it anyway. I use SSB to tune broadcast stations on the R-75 and the sound is very good with a wide SSB filter. That takes care of any fading. I would recommend an external speaker if you are a program listener. Radio Shack constantly puts a RCA speaker on sale for about $20 that is great. There have been several previous posts about that. I have not bought any additional filters, just running the stock filters. That seems to suit me. Not convinced the high price for optional filters is justified for me. Hope this helps with your decision.

Regard,
Bob

Bob,
Thanks for the first hand comparison of the SW-2 and R-75. You've given me the info I needed to make an informed decision. Look for an SW-2 on Ebay in the near future. BTW how does that Radio Shack/RCA speaker compare to the old Minimus 7's? I've got a pair of those sitting around.

Earthing your rig would probably not help.

I have the same problem in the dry winter months but only when
walking through my carpeted home with my shoes on. I find if I
walk around in my socks there is no problem with the static
build-up.

As suggested earlier this is a Lack of Humidity Problem and you
could probably solve all of this with a Humidifier of some sort.
Get a small Humidity Gauge and monitor your Humidity level. It
is more than likely below 30%

For now I just walk around in Socks for those problem months.

I can't do that at the supermarket though where simply picking up
a can of soup results in a shock! I hate that.....

There are other benefits to humidifying, besides the sparks. It's good for wood furniture, guitars and human noses; and makes a room seem warmer.

I'm not familiar with the Minimus line, but here are
the specs for my RC speaker so you can compare it to
the ones you have:
Model RCA PRO-X33AV
Radio Shack catalog #40-5000 (Page 175 of their 2002
catalog.)
3" woofer; 1" tweeter
Black die-cast aluminum case with metal grill (a heavy
speaker for its size and well shielded.)
Catalog price = $39.99; frequently on sale for $19.99.
Being as it is black, it looks real sharp next to the
R-75.

Regards,
Bob

The Minimus 7 has a 4" woof. I recommend a speaker without a tweeter for HF monitoring; less noise and hiss. My primary speaker is an RCA 10" movie projector speaker from the '30s. It is covered in brown Tolex and has a big red lightning bolt meatball "RCA" logo. I also like old Mocom speakers and the BarJan ProNouncer.

That may be the case if you listen to hams or utilities or are trying to dig out DX. I am primarily an international broadcast program listener and I find a full range speaker sounds better (and is less fatiguing) over long listening periods. Obviously, a full range speaker is going to sound better for music programs too. I do have an old Heathkit 'voice optimized' communications speaker I sometimes plug in if I am just going to listen to utilities. I also use a voice optimized speaker on my scanner.

If that's the case, I strongly recommend the Cambridge Soundworks PC Works sat/sub system. They are being closed out, frequently for less than $20. They'll make your radio sound like a Blaupunkt console.

BTW, a rigid cone, alnico 5 10" speaker like the old Jensens have usable response to as high as 8 kHz; I doubt there's much on HF that goes that high.

hi Bob:

1 - check out Mark Fine's $60 program 'Smart Icom Control':
http://www.fineware-swl.com/sic.html

2 - you may want to wait till you use the R-75 before deciding on a filter. if you're a big broadcast listener (/want fidelity) you may wish to consider Kiwa's mods or a 3.3 kHz ECSS filter. from what i have read most have been very pleased with Kiwa's AGC/Synch and 3.8 kHz filter upgrades.
http://www.kiwa.com/R75.html

3 - the R-75 is excellent for utility/amateur; the dual PBT allows the SSB bandwidth to be changed from ~1.0 to 2.4 kHz.

phil :)

Hi Tim,

would be hard to say, in some sense I would think they'd be on par - build quality on both is excellent (i had the R-2000 - and it was solid) and feature wise.....in terms of technology I'd like to think the 75 is more advanced, better filtering etc - however, please don't quote me on any of it - I have a relative who has both, and all i ever got out out of him is that they were "both pretty good" - hes got the 75 with DSP !! - so its just a little personal opinion...

One thing that drew me to the 75 (and caused me to decide to part with my 2000+VHF) was its simplicity - under the menus, is one heck of an RX, learn how to work it and its a great set - for data modes, its brilliant....its expandable....extra filters, control software etc....and its stability is great - compared to a 2000!

Bad things.....the handle and the feet are extra - at least in the UK....why do Icom want money for the little things like this ??? this should be in the box.....

however - thats a minor point....

The obvious one is this - take your R-5000 to a dealer and get the 2 receivers on the bench, same ant, and switch - Personally I think you'd be very hard pushed to decide.....

Mark

Topic: 1228 Message: 1235

Ken, I have owned an R5000 since 1990 and used to enjoy using it for my main DX radio. In July 2000 I bought an R75 with the DSP unit. Since then the R5000 hardly gets any use. The R75 (in my opinion) digs out signal that the R5000 can't and the audio in USB/SSB is better on the R75. I find the agc on the R5000 to be a real pain also. I primarily DX the BCB and really like the R75. Jim

From: E de Jong
Topic: 1236 Message: 1236

Hi!

I wonder if other R-75's also have this problem:

When the noiseblanker is off, occasionaly some cracks and pops are heard that mostly result in a strong decrease of audio. So I switch on the noiseblanker, hoping the cracks will disappear. They do, but another sound is heard. It's a more constant crackling, not so loud as the pops and cracks without the NB, but they do disturbe the clean signal.

Is this normal?

Phil,
I hope I am not repeating something already covered in this group, but could you explain the proper operation of the PBT controls for varying the bandwidth as you noted? Does this eliminate the need for buying a narrow SSB filter? Thanks.

Bob

Ed - I don't hear this on my R75, but I would wait until you receive more responses from others on the reflector before coming to any conclusions. Have you double checked for anything within your radio room that might be causing some problems? Light dimmers, Florescent bulbs, etc? Hope you solve it. 73/Tim Logan KB7OEX in Gilbert, AZ

The first phenomenom is your AGC reacting (correctly) to the burst (crack) of noise. If you put your AGC on a FAST recovery time, this effect will be minimized.

A noise blanker only works on the parts of impulses that are stronger than what you are trying to hear. The noise below the NB threshold (i.e. the loudest part of the "program" you are trying to hear) will not be affected by the NB. The DSP Noise Filter will help with the continuous low level buzzes.

This is "normal" if you have listen to a strong signal or their are strong stations within +/- aproximately 10 kHz. Mentioned as "distorsion" in the manual.

1241. filters for data reception

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-03 21:23:52 UTC
From: martin butcher
Topic: 1241 Message: 1241

I use my radio for allot of utility monitoring and was wondering about which filter for cw/rtty.As I see it the signal goes through the 9mhz then 455khz if filters,if I were to put a 250hz filter in the 9mhz if stage and used the 2.4khz in the 455 if stage the bandwidth will be 250hz as this is the smallest filter in thesignal path.Would there be much of an advantage of using a 500hz filter in the 9mhz stage then a 250 hz in the 455khz stage,or would the result be the same.

Hi Martin,
I use my R75 in much the same way, but mainly for LF listening with narrow filters selected. I have the 250Hz filter for both 9MHz and 455kHz positions. If I had to do it again, I'd probably just buy the (cheaper) 9MHz 250Hz filter, as adding the final filter helps some but not a large amount. The main improvement is sharpening the skirts and allowing tuning a faint sigal closer to a strong one (NDB, in my case).

Thanks for the info steve i also do ndb's hense the reason for a narrower filter.I think i will go with the 500/250 in the 9mhz stage as most of the software i use is pretty good at decoding signals anyway.

hi Bob!

to narrow the bandwidth all you have to do is turn the PBT's away from each other (or in opposite directions). for example: when i listen to hams i often turn the outer knob (9 MHz IF) to the left one white notch and/or the inner knob (455 kHz IF) to the right one notch. by fooling with the amount you turn each you can also alter the tone... more base/treble, till it's pleasant.

although this may not eliminate everyone's need for buying a narrow SSB filter, fooling with these is really all that i will ever need for phone (voice) dxing. i think i've gone through every scenario in my mind about these filter choices. what i have come to realize for me is that the stock R-75 is quite good. some random thoughts...

a) 1.8/1.9 kHz - can be simulated via above method
b) 3.3 kHz - one route for fidelity on AM using ECSS
c) 2.8 - pretty close to stock
d) 250/350/500 Hz - try using software filters first
Usage: plug the audio out line into your sound card's input

i decode CW, BPSK, and RTTY via software and here wider is better (i use dual 2.4 kHz) because more can be seen on the software's bandscope at one time. amateur/utility on the R-75 is EXCELLENT! AM is decent... i plan to get kiwa's $45 synch/AGC enhancement. more questions? fire away :D

Hi to all:

I've been monitoring the list, but do not have the r75 as of yet.
If I am not going to use it with a PC, is it worth the extra money over
let's say an ICF 2010 or a Sangean 909?
Speaking of sensitivity, durability, and overall manufacturing quality..

Thanks for the help,

Art

hi Art:

how will you use your new radio? SWLing? DXing? ham/utilities? the R-75 is extremely sensitive... 0.16 uV on SSB with the weaker +10 dB pre-amp (it also has a +20 dB pre-amp). the 2010 is ~0.49 uV by comparison. the performance of a tabletop, especially one as nice as the R-75 for dxing, is in a league above that of a portable. durability: the R-75 is built very well; the other two are junk by comparison. if you have the money get an R-75, you will not be disappointed... and if you're really into SWLing consider kiwa's mods. i have a sangean portable... haven't touched it since i got my R-75... it'll be on ebay soon enough.

phil :)

Tuning an AM signal as though it is an SSB signal. You want to "zero beat" the carrier (i.e. tune slowly 'til the whine turns to a hum which then goes away). Then I like to adjust the passband slightly away from the carrier to reduce the modulating effects (gargling sound). In the old days, the R390A was really good for this 'cause you could work the passband against the mech filters with the KC knob and zero beat with the BFO.

Exalted Carrier Selective (or Single) Sideband. The other benefit of
this mode of receiving AM is that you can switch between LSB and USB
to get the least interference.

Thanks Phil I will give this a try. I agree that the stock filters do a good job. They work well for 95% of my listening habits. With the price of the optional filters, I am not anxious to spend the money unless the return is reasonable enough.

Regards,
Bob

I'll attest to the fabric softener trick. I had a little playset for my kids that built horrible static electricity when they slid down the plastic slide. So much so that their hair would be standing on end while going down (funny to watch, but a annoying to them if they touched anything). A couple of wipes with a fabric softener sheet (Bounce brand) and the static problem was gone.

I try to keep strange chemicals out of my environment, as much as possible, especially aerosols.

Sears is having a sale on their big humidifiers (Kenmore-actually Emerson) this week.

I'm personally biased towards Universal Radio due to the out standing service they've given me over the years. Probably the lowest price is available at kjielectronics.com. I have no personal experience with them, but have seen good reports from others.

73,
Alan Johnson

Art - I do not know if it's of interest to you, but I would not mind selling my R75 which I got a few months ago. I had the KIWA ELectronics mods done and have two filters in it. I just don't use it enough. Filters are an Icom 2.8 and an Inrad 1.6. Total dollars into it is arpund $950. I would sell it for $750 including shipping if your in the CONUS area. I'm not trying to be pushy, so please forgive....just thought I would check. Thank you.

> DeWayne KE9K

I paid $520 used for mine awhile ago; recently, I had the *complete* Kiwa mods installed for $170 plus about $22 shipping (both ways). The total is slightly over $700; the result is a first-rate radio. The AGC/Synch mod is the most critical one, IMO, and makes a huge difference, although I really like the new 3.8 kHz filter (which I now use as my normal filtering mode). I have no way to gauge how much improvement in audio you get from the audio mods; I would have to hear two radios side-by-side to tell...so I don't think the difference is big. I never thought the audio was bad with headphones or a $20 speaker anyway.

Topic: 1229 Message: 1267

I have used AES, GROVE and HRO and
always seem to come back to HRO.

HRO's 10 day return and exchange for new
if the originally purchased unit is bad always
gave me peace of mind even though I never
had to use it.

Once I had a ICOM HT fail after the 10 days
and Atlanta HRO promptly repaired and
returned my unit under warranty at no charge
and it was like new.

HRO's restocking fee is 15% where KJI is
20% if you dislike the radio completely.

I found this not at KJI's website:

"Please note: We are closed from February 7
to February 23, 2001."

This appears to be a very small operation which
is not necessarily something bad but it does have
it limitations as shown.

Hopefully you did'nt need support from them
during that time.

Personally, I wanted to buy an R75 from KJI but
emails to them were never returned. This was for
an R75 he had up for auction on e-bay. I also
contacted HRO through the same e-mail means
and was able to make my purchase at a price I
was happy with.

So look at the little things as well as the price
when shopping around.

1269. Re: [icomr75] noise

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-08 20:26:54 UTC
From: Al Smithson
Topic: 1266 Message: 1269

I own an R-75 and the DSP noise reduction is dramatic for general and thermal noise. The Noise blanker works ok for pulse noise but I find the automatic noise filter barely effective on notch rejection. Over, all the combination of the three above features with the passband tuning is extremely effective and is the best I have seen in this price range in the 30 years of listening. It (the combination) can truly turn a marginal signal to very readable or an unusable signal to readable. I just acquired an MFJ noise canceller (phasing unit), but I haven't had enough time to evaluate its effectiveness. Preliminary results appear to be good and I am optimistic it will yield great results.

Hope this helps.
Regards,
Al

1271. R-75 used for transceive operation?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-08 21:51:59 UTC
From: maritimus49
Topic: 1271 Message: 1271

Hello Everyone -
I am trying to find out if the R-75 can be used in a transceive setup with a transmitter? I have the Drake T-4XB which was ised with a companion receiver in transceive mode with the appropriate cables. In other words does the mute jack on the back respond to the same kind of grounding that is usually offered by a muting cable from the transmitter or is it different? The manual goes into this discussion of "C-IV" transceivers but I can't be sure if it would work the right way with my old boatanchor. Just curious.

73,
Bruce

I bought mine from Gigaparts. They beat the lowest price I could find including dealers listed in this string. I e-mailed them with the price and web address and George replied with a better price. I have purchased other equipment from them and received excellent service everytime.

Good luck.

The radio (not an R75) was over a month old(beyond the
10 day replacement period) therefore repair but no
exchange.

That's was my distintion here that usually something is
going to fail in the first month or so and you really need
your dealers support at that time. This is the little fine
print that no one is aware of till a problem pops up.

I am pretty sure HRO Atlanta technicians repaired
it because it came back pretty fast. The trip to ICOM's
west coast repair center would have taken much longer.
I was happy with the radio and it lasted over 10 Years
so the repair was long lasting.

Grove has such a liberal return policy that a person I
know of would buy radios from Grove & then try them
out for a week or two and send them back and get a
different one. Sort of a way to personally review radios
without the purchase.

I always wondered what would happen to the opened
box, used radio?

He also was famous for doing this with Office Depot
as well !

All:
IF you are in a place / area that makes for Static Electricity
- Get a CHEAP ground strap, (you can buy one with a P.C repair Kit)
put it on your wrist
& the other end on a WATER pipe / radiator, etc.
THEN
- no more sparks!

This is scary. Perhaps buying from a dealer with a liberal return
policy isn't such a good idea, if you plan on keeping the radio?

If you can't tell the rig from a new one what difference does it make? I've been buying from Grove for nearly 20 years without any problem whatsoever.

Yes, I find that the AM sensitivity is very good, but I usually use very long outdoor antennas. Some people have posted info on increasing the MW sensitivity, but I see
no need to do so. I have not done the Sync mod either and don't think I am missing much. The AGC mod was very useful however. Jim

Rado and John, thank you for working on improving the S-AM. I've built the 2.1 mod today and it works great. I was not very skilled in doing such things, so it took 8 hours (incl coffee breaks:) to do this brain surgery. I've uploaded the final picture in the mods area.

I have one question. Could you please explain in layman terms what R5 and R6 values do? I left the pot in the middle and put 1 kOhm for R5. What should I listen for when rotating the pot?

Best regards,

I just checked. Universal is selling the R-75 for $570 including DSP. Gigaparts is $499 with $50 off the DSP which makes it $589. As long as shipping is below $18, Universal beats Gigaparts.

Counting free shipping Gigaparts is nearly $100 cheaper than Grove and Universal.
DeWayne KE9K

I feel it's my resposibility to help the hobby stay alive. I always do business with fellow hobbyists, even if it means paying a few bucks more.

I go to HRO, because I can smell the equipment and look 'em in the eye. If I mail-order, it's Grove or Fred.

I just checked their web site. $500 shipped for the R75! Best price
I've seen by far!

I received an email from Gigaparts. George Howard said :

Hi DeWayne!

I do not have them in stock at this time but should get them around the end of the week. The price is $499.00 to your door.

73
- George

From: Todd Gaine
Topic: 1217 Message: 1289

I move around in my shag a lot too. Perhaps if I tied my girls wrists to the radiator it would help. Driving home the earth spike would be fun.

--- In icomr75@y..., efricha@d... wrote:
> >
> > In my shag I move around a lot. Two keyboards to operate, a scanner, the Icom, etc. So while I'm swirling around on my chair (one with wheels) I seem to pick up much static current. Whenever I touch the Icom (or the scanner) the sparks are flying between my fingers and the metalic rigs. And that's not pleasant to say the least. I'm sure the cause is a lack of earthing of the rigs.

*Mail in coupon DSP UT-106 Module 3/31/2=Free DSP until 3/31/02

*$50 off 2/14= $50 off until 2/14

It's $500 shipped to your door. Don't argue, Save $90-$100!

Bob

1291. Am ATTENUATION Mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-11 11:48:02 UTC
From: lew47oz
Topic: 1291 Message: 1291

Hello from Adelaide, I am looking at doing the AM ATT Mod shortly, & wanted to know if any resistors have to be removed, as well as the shorting procedure. I remeber reading about the subject, but can't find a reference now I want it.
Cheers Lew Chapman

1295. Re: Am ATTENUATION Mod

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-11 18:02:22 UTC
From: Eddie Bryant
Topic: 1291 Message: 1295

Just solder a SPST (single pole single throw) switch to the
solder pads shown in the .jpg at the "R75 Mods" section
of the "Files" Area here in this group.

I found it can make a difference of anywhere from 1/2 an
to 1 and a half "S" units difference.

Whether it decreases the S/N you will have to see for your
self. I don't do too much listening down there but it's nice
to be able to have a switch to control it. I suppose you could
place a solder bridge across it as well and permanently Mod.
it.

There is another AM Attenuator Mod "Message 576" that
involves changing several resistors and adding an inductor.
I did not accomplish this one as it seems to be a little more
difficult.

Maybe someone that has will jump in.

Below is a repaste of it:

Ed
N4UMJ
==========

I picked up a service manual for this receiver. It seems that 100 Ohm
current limiting resistors are used as the series Rs with the switching
diodes in the front end. In an earlier post, I mentioned that the shunt
Rs in the MW attenuator were providing the return path for the switching
diode in the front end. I calculated the equivalent resistance of this
network to be 139 Ohms; that is the reason that I specified the 2.2mH
choke in series with the 110 Ohm resistor.
Anyway, I did change the 10 Ohm series resistor that Icom has in their
unit to the 100 Ohm unit that is used in all of the other filter ranges;
this eliminates the need for the extra resistor that is in series with the
2.2mH choke. I didn't like the fact that the 2.2mH choke is self-resonant
at around 900KHz, so I switched that value to a 1mH Murata surface mount
inductor. It may be because I eliminated some of the parasitics that were
present with the 2.2mH choke, but the sensitivity on the LW band improved.
The .1uV spec is now maintained down to 150KHz, degrading to .2uV at
100KHz. This is because of the noise floor rise at 100KHz and below,
maybe due to the close-in phase noise of the synthesizer.
Now, if I got a little bit confusing with my explanation, I'll get to the
point. To remove the MW attenuator, remove R171 and R173 (270 Ohms), and
replace R172 (18 Ohms) with either a zero Ohm resistor short that

connection point pad that is supposed to bypass the attenuator (it really does not, unless you remove R171 and R173). Next, change R174 (10 Ohms) to a 100 Ohm resistor. Finally, add a 1mH surface mount choke across the point where R171 was connected.
This is to provide the DC return path for the switching diode. You could use a leaded choke, but the main thing is to keep the leads as short as possible.
On a final note, I must caution anybody that these parts are relatively small; were are talking about 0603 (.06 by .03 inch) parts. You really need to have some sort of magnifier or stereo mircoscope of close up reading glasses to do this job. Also, you need a good soldering iron with a small tip, such as a Pace, Metcal, or Hayco soldering station to do the job. The reason for this is that you need to be able to concentrate the heat in a very small area. If anybody has any questions, feel free to give me a shout, and I will walk you through the job.

Pete gianakopoulos
Chicago, Il.

Addition by Rado:

Well, the procedure is not very simple. I expect a substantial effect if either R171 or R173 is removed together with the shortening of the pad. This will increase the resistance to ground from 135 Ohms to 270 Ohms.

Best regards,

Rado

RE: YES, you can use the R75 in conjunction w/ a transmitter. You must provide the R75 with its own antenna OR you must isolate the R75 from the transmitter's RF output, if using the same antenna. This is imperative, as the mute alone is not sufficient to protect the receiver from the high levels of power being pumped into the antenna jack. If your "boat anchor" transmitter has a built-in relay to provide this isolation, and it works, then you should be okay. Usually these older transmitters had two antenna jacks, one labeled for the antenna, one for the receiver. During transmit, the internal relay switched the RF from the transmitter into the antenna jack and away from the receiver jack.

If your transmitter does not provide this arrangement, you can use an external coaxial relay to furnish the antenna switching. I have used my R75 in exactly this fashion, but with a modern transceiver (yes, transceiver!---the receive section of my Alinco DX-70 is vastly inferior to the R75). I assembled a simple RCA-to-RCA cable for the mute connection, in parallel with the DC coil of a Tohtsu coaxial relay---works like a charm!

Hope this helps!

1299. icom r75 antenna switch relay

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-13 00:52:15 UTC
From: Jem Cullen
Topic: 1299 Message: 1299

HI Dan

I saw your post about using your r75 witha txer.
I have just picked up a Kenwood TS440s, and even though they are on seperate antennas, the antennae are only about 1-2 metres apart. I would be interested to know more about the antenna switch you hooked up. Exactly how you made it etc.

At the moment I either disconnect the antenna from the r75 or turn the darned thing off (or both) before transmitting...but sometimes one forgets

Do you think the r75 could be damaged by my txer ont he nearby ant if it was switched off but still connected to the ant?

Anyway if you could provide some details, for the not so technical that would help

1300. RE: [WUN] Icom R-75 & PC-ALE

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-13 01:31:30 UTC
From: esptwo@comcast.net
Topic: 1300 Message: 1300

My apologies for the earlier "no subject" posting.

Ed Pusey

Friends:

Sandy Abel was very kind to get me well on the way to PC-ALE monitoring, but I've been unable to find correct settings to have my ICOM R-75 pause correctly upon detection of ALE signals. I know what they sound like, and if I slow the scan rate to "1," I can stop the scan and receive the transmissions fine when I hear one. Problem is the R-75 won't stop on its own. Everything else seems to work fine. Any hints would be appreciated.

System 1:

No Name 550 mhz P3 w/Windows ME

Soundblaster PCI 128

Icom R-75

Audio connection made into "line in" - signal very visible in signal window

Have tried multiple variants of DCD threshold, tx/rx audio levels with no discernable differences

System 2:

Compaq 1.7 ghz P4 w/windows XP

SoundMAX Integrated Digital Audio

The rest is the same, with the same problem

I'll be happy to post the "successful response" if I receive one.

Thanks all.

Ed Pusey

Welp,

Just ordered my ICOM r-75...
What's the buzz regarding the AM sensitivity mod. Should I investigate my radio when I get it to
see if it should be modified?
I guess I'll send the coupon in for the DSP when I get it.

Thanks for the help...

Art

1306. Phil's SSB/ECSS Mods... Help Needed!

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-15 23:42:21 UTC
From: just_rtfm
Topic: 1306 Message: 1306

hello group,

i have some ideas for R-75 mods and need some input. i listen to almost everything using SSB or ECSS. the problem is that i want more fidelity (ECSS) and more volume.

to improve fidelity i propose to place a 3.0 kHz kiwa filter (SFM) at the 455 kHz IF position. this should be 'easy' mechanically: a voltage and ground hookup, solder the input and output leads to posts and place them into the PCB holes. this filter only costs $50 and has no insertion loss (buffered)... good for ~7 dB gain over ICOM's.

to improve volume i am still studying the R-75 schematic. if you are skilled in electronics please offer your help if possible. apparently the SSB chain (MC1496 mixer) is putting out below what the AM (MC13022) and FM (NJM2058+) chain are just before the AF selector input. i have a few ideas: one is to short pin 2 and 3 of MC1496 to allow 'maximum' amplification: ~3.5 V/V. as of yet i have no idea how this will effect the linear dynamic range of the component. ICOM currently uses a 1.5k ohm resistor here. soldering another resistor in parallel might also be viable (if maximum is too much). another idea would be to add a transistor amplifier between the MC1496's output and the AF selector.

i have uploaded under: 'files' --> 'r75 mods' a schematic of the regions in question... it is called PhilMod1. i belive that boosting SSB volume would make this receiver shine. thank you in advance for any assistance. i hope Dr. Danev is around to offer his input.

phil :)

Topic: 1307 Message: 1308

I tried the demo. It works very well, but I am using the radio "hands-on" in the garage. I use Smart R8 Control 32 for the Drake in my office; it is very handy. The SWBC listings (just like in Monitoring Times) and Utility listings are "clickable" and tune the radio. Conversely, if you are "spin tuning" and need to identify a station, click the display once and the database record appears,

You can also manage memories and import databases, which is handy for some people.

Last. I had a problem once and Mark Fine walked me through the troubleshooting, no extra charge.

1309. Antenna: Baluns/Transformers, & New Wire Installation

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-17 01:28:19 UTC
From: pjrohio@ntr.net
Topic: 1309 Message: 1309

Hello, fellow SWL IC-R75ers...

Saturday, March 8th was a 'breezy' day in Ohio.
Down came my old RS inverted-v dipole, smashing
the balun/transformer, and exposing the innards.
(Ok, the mast wasn't secure as it should've been.)

:-o

The balun/transformer is still functional.
I learned 'Shack hasn't sold this dipole for
a number of years now.

So, I purchased some new, heavier gage wire (14),
70 feet worth. The original dipole was 20ft per
leg. I strung-out 30ft per side this time, using
the beat-up balun/transformer. (I wanted to favor
night SWL, hence the the longer length this time.)

Reception is stronger across the band (3-22MHz)!
Example: 5.070 is now reading '20' with ATTenuation
(in CW-REV ECSS mode).

Questions: If I want to get another balun/transformer,
what type is the one I now have? What type should I be
using, if it is indeed important? (1:1, 9:1, 50:1,
1,000,000:1) (Receive-only application.)

I don't know if I would want to build my own, but if I
do, info on that is welcome.

Thank you, Patrick.

Has anyone thought about interfacing a basicstamp II with the db9 on the
r75?
It seems like it could make a pretty slick infrared control, allowing you to
change freq and
other parameters remotely without a PC...
Can you change the volume through software?
I should be getting mine Tuesday, and look forward to a little
experimentation.

Thanks,

Art

Hi All,

I just recently purchased the RCA Pro-X33AV ($20)
mini speaker from Radio Shack (Cat 40-5000 page 175).

(After plugging it in...) Nice.

:D-)-(

Has anyone tried the 40-5024 (page 180)?

For Even Louder Audio:

I also use the 21-549 Extension Speaker sometimes,
which is normally used with my police scanner, for
some real loud audio punch (page 104). I may purchase
another one. These are awesome speakers. Nice
sensitivity and voice-enhanced. 10-ft cord.

Still need more audio DB?
The 21-541 is the amplified version (needs 12VDC).

- Patrick

I was so impressed I hooked up two of the Optimus (R-S)
PRO-X88AV's on each side of my video monitor and no
they are not connected to my computer. Just the ICOM.

Great sound on these speakers! (emulated stereo I guess...)
I also found the smaller Radio Shack XTS 25 (40-1999A)
to be a great little speaker too. I use that one on the R-75
in the Bedroom.

I tried using the Radio Shack 21-549A but it had a tinny, brash
sound to it. Either of the other two above really bring out the
fuller audio. If you have'nt treid an external on your ICOM
you are missing out on the potential of the R75.

I used a 4 way Sony headset switch box to switch between all
three and compare.

Art:

I'm not sure what you are asking here. Yes, the control codes for the R75 are listed in the manual. However, communication with the rig is a somewhat complex protocol that is shared with many Icom radios.

If you are interested in doing this, I suggest you refer to an excellent web site that provides a great amount of detail: http://www.plicht.de/ekki/civ/civtoc.html

Good luck!

I purchased the R-75 software from the vendor and can communicate directly between PC and radio through the serial port/serial cable. From what I understand, the CI-V is used to control more than one Icom radio from your computer.

Fry's was selling them for $20 a few weeks back. They have an inline volume control and come with a wallwart and everything. The woofer goes on the floor and the cubes have a very small footprint. I have one on my PC soundcard and listen to the Drake through them. Very warm. I don't like seperate tweeters on AM radios.

I also dislike Radio Shack with a vengeance because before Radio Shack we had Lafayette Radio Electronics.

"I tried using the Radio Shack 21-549A
but it had a tinny, brash sound to it..."

Hello Ed,

The 21-549 isn't a 'full range' music speaker. It
is a 'communication/voice' speaker. Very useful if
one would need larger volume to be heard over noise
or if one is at some distance from the radio.

Is that what you mean by 'tinny/brash'?

If so, then it's a good 'tinny/brash',
considering what it is designed to do.

:D

I couldn't find the Optimus PRO-X88AV. Did you
mean the '880'? They probably sound fine, but
for my application, I didn't want to spend anymore
than around $20 for an external speaker for the R75.

This Pro-X33AV sounds just fine to me on my ICOM.
I'm curious about the XTS-50AV. I may try it.
I like the way it looks. I'll stop by the 'Shack
and see what the db sensitivity is.

What page (2002 catalog) is the XTS-25 on?

- Patrick

I find them very handy as a pleasant sounding general purpose speaker. For my R75 (strictly utes) I use a Bar Jan Pronouncer, 4" communications type speaker.

I also have a 10" RCA (Camden N.J.) movie projector speaker from the '30s I use on the Drake, when the computer's powered down. There's tons of cool sounding A/V stuff at Pawn Shops and Thrift Stores (DuKane, Webcor, etc.).

Hello Patrick and all,

> The 21-549 isn't a 'full range' music speaker. It
> is a 'communication/voice' speaker. Very useful if
> one would need larger volume to be heard over noise
> or if one is at some distance from the radio.
>
> Is that what you mean by 'tinny/brash'?

I use the 51-549 in the car for my ICOM amateur
radio and it sounds fine. Seems like when I am listening
here at home the smallest of things can be discerned that
would be drowned out and ignored when listening mobile.

I must admit the 51-549 was the loudest of all the
speakers I tried. But at the expense of a natural full audio
range.

I listen to mainly Amateur AM/SSB and some Broadcast
AM on my R75.

> I couldn't find the Optimus PRO-X88AV. Did you
> mean the '880'?

It's been years since I have bought any speakers at R-S.
It appears that Radio-Shack no longer carries any of the
ones I mentioned. As a matter of fact it appears the RCA
name is on all of the speakers I looked at in their catalog.

The Optimus PRO-X88AV was the correct number- Cat
#40-2084. I admit it is overkill with the tweeter but they
do sound good and they were not being used in my speaker
arsenal! I got most of these speakers when Radio Shack
would slash prices yearly. If you can wait around it's worth
it.

> This Pro-X33AV sounds just fine to me on my ICOM.
> I'm curious about the XTS-50AV.

The XTS-25 is a great sounding speaker and a recent
look through their catalog looks like they have discon-
tinue it too. It has a nice woodgrain finish and a single 4.0"
speaker. It is just the right size for the R75 and I picked
up several when they were on sale for around $15. It
apparently has been discontinued and I believe replaced
by the smaller XTS-50AV. Not too sure how it would
sound. I suspect the larger case of the Pro-X33AV

would sound better than the XTS-50AV but I may be
wrong.

All this is very subjective and what sounds best to me
may sound awful to another. I was surprised at what I
found out when I went to experimenting with an A/B
switch and the different speakers I had handy here.

As for Daves comment:

>"There's tons of cool sounding A/V stuff at Pawn Shops
> and Thrift Stores (DuKane, Webcor, etc.)."

I totally agree! A trip to any Goodwill or Salvation Army
or any other Thrift Shop sometimes reveals some good
and rare deals. Sometimes not.... So you have to be
persistent. But the wait is worth it and the price is usually
right !

I'd suggest you try the free demo. I was interested in the "click to tune" feature, but I found the database to be somewhat skimpy compared to Monitoring Times and even other free sources on the 'Net. Maybe someone knows if the "paid for" database when you register is better?

I think generally you can "push buttons" in software, but you can't turn any analog knobs. As far as I know, that means you can't change the volume or work the PBT or RF gain/squelch.

Keep in mind that the voltage levels coming out of the stamp are TTL 0/5 volts instead which might or might not work with the R75 which theoretically needs standard RS-232. Or you can rig up a cable from the development board's DB9 port to the R75 - watch the pin-outs - I'm pretty sure a standard cable won't work.

I hooked up an old computer speaker (the passive one) and it works ok. I'm thinking about ripping off the plastic housing or drill some holes in it to get rid of some strange resonance at low end. Anything is better comparing to the R-75's tiny internal speaker.

I bought Sennheiser HD600 headphones a while ago for the hi-fi system. They are also fb for picking up DX. They are open design and I can wear them for 8+ hours without any discomfort. It's probably overkill and expensive if used just for SW listening.

Back before Radio Shack, you could get a nice 8" full-range in an angled real wood box for $10. You still see them occasionally, in the funky part of town.

You can control both volume and squelch with the Icom CIV
communication protocol.

For an excellent web site the provides details on the Icom CIV
protocol, see: http://www.plicht.de/ekki/civ/

Good luck,
KD7OFV

Yes, but is this the same as communicating with the receiver through the DB9 port on the back?

The list of CI-V commands or the list of commands in the R-75 instruction manual work using either the CI-V jack OR the DB-9 pin serial port on the back of the radio. The only reason one would prefer to use the CI-V port over the serial port would be if he used a CI-V interface from Icom which allows up to 4 units to be controlled at once by assigning them each their own unit ID. By the way the receiver default ID of the Icom R75 is 5A(hex) which is 90 decimal.

ENJOY!

Wayne.

1345. R75 vs R8B?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-24 18:08:13 UTC
From: b_scho
Topic: 1345 Message: 1345

Is the performance of the R75 with all of the Kiwa mods equal to the R8B? I have an R8B that was purchased used and am looking to purchase another receiver. I'm currently playing with the TEN-TEC RX-350 with 2 weeks to go on the 30 day trial. Great potential but I think they put it on the market a little to soon. Debating on sending it back and getting the R75.

Thanks...Bob

For me, it's apples and basketballs. The R8B is a smooth sounding receiver I use for program listening and some mainstream Utes (e.g. GHFS). The R75 is for utilities in SSB and difficult DX. The Ten-Tec is a lot of money, if you have doubts.

1347. Re: [icomr75] R75 vs R8B?

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-25 17:05:51 UTC
From: Bruce Jensen
Topic: 1345 Message: 1347

Hi, Bob - Even modified, the R75 does not have selectable sideband S-AM - that is, it is incapable of fully isolating the one desirable sideband from the other when the carrier is reinserted. One can approximate this using the PBT in the S-AM mode, but there can still be some bleedover from adjacent frequencies. Make no mistake, it is better by far than the unmodified R75, and it is really pretty darn good - but occasionally, there will be that station that responds *only* to using the ECSS method (which works beautifully on this radio).

Also, the R8B simply has more filters than the modified R75, and they can work in all modes. If you want to do utility work, you may want to grab another more snug filter for the R75.

The Drake is also said to have better audio; this is probably largely squared by the addition of either headphones or a decent external speaker. Being an SWL and DXer, who likes hams but without much interest in utes, the R75 with mods does everything I'd like with aplomb, and I cannot imagine the R8B could be much better for what I listen to.

The R75 also looks and feels really good :-)

Good luck with your decision!

Bruce Jensen

Short answer: At some point in time, all of the data was pretty much similar.

Long answer follows:

MT's Shortwave Guide consists solely of English Language broadcasts. So are the timed data in Smart Control (with some small well-known exceptions for some African stations). Smart Control's database also adds some non-timed utilities and broadcast band listings on top of that, regardless of version. That being said, the completeness and sheer quantity of the timed English broadcast data in all three are essentially the same. The *currency* of the data is a different story altogether:

1. MT is published monthly. I work with Gayle Van Horn to help her have the most up to date info for publication. Additionally, the changes I provide to SWBC Schedules on a periodic basis are the same ones that I provide to her. Other than that, I have absolutely zero authority to speak for MT on this issue, so I'll gracefully exit on that part of the issue right now.

2. I don't update the data that comes with the *demo* program(s) on a regular basis. Therefore, the data it comes with may be only current to the date of last release. Naturally this also varies from version to version (i.e., Icom vs. Drake vs. Kenwood, etc.). The idea of the demo is just that... to get an idea of how it's supposed to work, not to give you a free application that you can use forever. In fact, the license for each demo has a 60 day limitation although there's no physical timeout limiting it's use.

3. I do provide an updated data set with all newly registered versions. The full program also allows you to import the SWBC Schedules data. The alternative is that you can update the data on your own - also a capability in the full version. SWBC Schedules data is now provided free of charge to everyone, so there's no longer that restriction. Now for the fun part - I actually build SWBC Schedules from my local copy of Smart R8 Control, then run a second program to export it into the dBase format.

So if you originally meant the currency of the data may be different in all three - yes, that may be true. It's the term "skimpy" that I take issue with.

Hopefully, I've answered this question as completely as possible (and put it to bed). If you or anyone else has any other questions, recommend we take

this off-line from the R75 Group. It may be interesting to some people, but not really pertinent to the R75 per se.

I haven't noticed any bleedover with the 3.8 filter. Could you describe it?

The 7030+ works the same way as the R75. I've never heard anyone complain.

The other thing is that on the R75 in S-AM mode, I think the radio chooses the better sideband (when shift == 0) cancelling the remaining one out -- maybe someone can confirm this?

What do you mean by far better? Most of the time, the ECSS method produces goods results on the R75.

You can have as many filters with similar values in the R75 if you so choose.

The R8B audio is mellow (like a french horn versus an electric guitar) and sometimes the bass is a little dark/muddy (difficult to make out the detail). One should also note that there is an audio

filter in the path of the sync detector on the R8B -- this helps to
give the illusion that there is a benefit.

Hi FRiENDS:
I put side by side a R-75 and a R8b and
receive some E-mail from over the world from people who did the same
test I experienced that the R-75 outperform the R8B in SENSITIVITY in
very weak signal[sometimes when I only listen noise in the R8B I can
listen to programs in the R-75],in SOUND[the bassy sound[thats why
drake sell a speaker for the R8 series] don't let you to pick up the
words cleary[in very weak stations] like you can listen in the R-75
that has a clear sound with his no "bassy" speaker.In SELECTIVITY the
R-75 with his kiwa filter 3.8 performe alike the R-8B 4khz filter.You
can tune the r-75 in 1khz increment [with the R8B no].The R-75 go to
60MHZ the R8B only
30MHZ.About the R8B sync myth for the R8B the sync det is a live or
dead issue.Remember the R8B circuit is 10 years old[from the
discontinued R8].And have PLL flaws that you correct with the sync
det.My R-75 now is working but I do not need to use it to
often,because the R-75 have an stable circuit. The R-75 has a DSP
for wipe out some noise but with the R8B if
you have some noise the only think you can do is turn the tone
control down but in the place of noise the "bassy" sound increment and
now you have a "bassy hiss", this is worst than the hiss alone.The
Icom too is super for utility.Icom with a super discount let us with
some money to improve the flaws of the R-75 for less than
$150.00.With a complete mod R75 you spend a total $680.00 and save
$700.00 over the R8B.Really is not the price but the R-75 performance
that count.

hi Ken! :D

> Truly there is no perfect receiver.

you're totally right Ken! the R-75 is not perfect but since we have such a great r75 community (and some individuals talented in electronics!) many of the mods that we want are already well documented. i am gathering parts and my soldering iron is ready. if the broken sync is what kept ICOM selling their unit at $520 instead of $1000 i hope it's broke in their next version too ;).

hi everyone:

i looked up the spec sheet for the R-75's audio power amplifier (LA4425A) and although it can handle an operating load from 2 to 8 ohms, it states that 4 ohms is the recommended load resistance. since the chip is really a car stereo amplifier i suspect the 4 ohms it is aimed at are two 8 ohm speakers wired in parallel. has anyone used this configuration externally? any thoughts?

phil :)

I just measured the resistance of the old computer speaker I was using on my R-75 and it's 4 ohm. That explains why it gets loud very fast as I'm turning the volume knob. I don't think anything bad can happen as long as you don't turn past 12 o'clock. Otherwise the amp may start to heat up. I wonder if it is located anywhere near circuits that may be affected by extra heat?

regards,

There is absolutely nothing in the spec for the Motorola chip used to
support this idea. I suspect a little wishful thinking.

There is no extra filter in the signal path, unless you are referring
to the phase shifter which is part of the detector. BTW, ssb and sync
go through the exact same signal path.

hi Vasiliy!

thanks for your input! i am still working on a mod to equalize the R-75's ECSS and AM volume. i realize that a mod exists to decrease the AM chip's output; however, i believe the SSB chain has inadequate gain. when i turn the AGC off on both AM and SSB... and turn the AM volume till i can barely hear the station... then switch to SSB... i have to turn the volume very far to the right.

to complicate things an increase in RF gain will equalize this: someone e-mailed me and suggested that this could be caused by the carrier's effect on the AGC when doing ECSS. i believe the problem is due to the AM chip providing a greater gain than the MC1496 mixer does on SSB. i am not an EE... i need help! lol.

the main volume control seems pretty touchy... God help anyone who turns it all the way to the right lol... maybe this needs fixing too.

> I wonder if it is located anywhere near
> circuits that may be affected by extra heat?

i am honestly unsure of the layout. i believe the chip is capable of ~1 Watt in its current setup; it is only rated at 7.5 Watts with proper heat sink.

phil :)

1365. Drake audio and filters vs Icom

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-27 04:05:23 UTC
From: frscistercian
Topic: 1365 Message: 1365

I have an R8A, and a friend has an R8B.The sync am on the B is real nice for program listening, however for weak SSB use the drake audio is poor.In addition, the shape factor of the drake filters is not too good...I would like steeper skirts.I hear too much leakage from strong adjacent signals, even with the 1.8kc filter.The pbt is little help, since by the time the leakage is gone the audio is real poor.I dont have a R75.I use a R-8500.This has exactly 1 selectivity for SSB.And in use, it nukes the drakes.It has nice clear audio, better sensitivity, and recovers listenable signals where the drakes produce bassy mud.I wanted full spectrum coverage, so the 8500 over the 75 here.But I suspect the 75 is the hardcore ute/dxers choice vs the Drakes, and the price difference is extreme.The Drakes are nice for the program types.....but I like my Icom a lot more.If full spectum is not an issue, the R75 has to be the king.As to comments on the WJ and ten-tec monsters.....these kilobuck rigs have problems that will drive the fastidious insane.The WJ features digital hash in the audio (how lame is that) and the ten-tec's close in dynamic range is bad.VERY bad.That said, they do recover audio really well.But their flaws combined with the high price would have me climbing the walls. Don't believe the hype.If you cant hear it with a 75, go with a bigger antenna.In the future,when 32 and 64 bit DSP at higher frequencys than currently exist become common, a paradigm shift in performance will occur...but the current stuff doesn't meet my price vs performance criteria yet.
R75 vs R8B......R75.

Perhaps I was thinking of the blend and noise reduction feature of the
Motorola chip, whereby the (stereo) co-channel interference with a
large L-R component is reduced (blended) producing a monaural signal.

I read it in Drake literature. When I find it again, I'll post it.

hi frscistercian:

thanks for your input and honesty. i agree with you! all receivers have flaws; i would rather have the one that is $520 with a great user community and documented mods. the R-75 has a solid PLL, fine tuning steps, sensitivity, twin PBT, and DSP ANF & NR. God help someone who tries to add these features to a rig as a mod. :D

i may put a 3.1 kHz kiwa premium filter module into my R-75 for ECSS... it is $75 and provides ~100 dB ultimate rejection.

i suspect ICOM will take it's 756 Pro II's DSP technology and dump it into their next receiver. btw, i have heard a /lot/ of good things about that R-8500!

I'll take the DSP but I do not particularly like the sound quality of the 756PROII. And when it comes to basics, it's not a better (or worse) performer than the R75.

> btw, i have heard a /lot/ of good things
> about that R-8500!

The R8500 is a little outdated, though it has great blocking performance. Now if only they can take the R8500 and update it with some SWL features and filters, and maybe even DSP (maybe add some trunking abilities for UHF and increase the scanning speed), etc. That would be a killer receiver.

I can't find the literature anywhere but if someone has a block diagram etc. would you be kind enough to confirm whether there is an audio filter in the audio amp section?

Anyway, one reviewer on eham.net wrote about the R8B:
"The radio has a "warm" sound that is most pleasing to listen to, although one must consider that some of that sound is a result of a 5KHz audio filter that is inside the design of the audio amp section of the radio. It would be nice to have a little more high freqency response in AM Broadcast."

There is a 5 kHz filter in the audio. It is used for all modes.

Phil,

Hmm, I just typed a long response to your message and got an error on yahoo server. I think it got lost. I'm to lazy to type it again:)

In short, the reason you see the volume difference with AGC off is because you are discarding some of the signal strength by switching from AM to SSB and not compensating it by increasing the RF gain. To understand this better, review how each type of demodulation works.

You can also confirm this by looking at S-Meter as you switch from AM to SSB (with F.AGC on and RF gain at 12 o'clock). You will see that the signal drops a couple of S points.

I agree the volume knob is sensitive when listening to a +40 db AM station. But it comes handy for hams trying to copy a CW signal at noise level on a quiet band. You really have to crank it up (possibly with pream on) to get advantage of a low noise antenna and the reciever's great sensetivity.

best regards,

hi Vasiliy!

thanks for the response, what you said makes sense. looking at the schematic the AGC circuit is fed right before the AM chip and SSB mixer. the mixer may have slight gain but the AM chip is capable of much more gain. do some manufacturers use an audio AGC to keep the level constant (no matter which mode or filter) that is being fed to the audio amp?

i drew up a more simple solution using an op amp with variable resistor to increase the gain to the point where SSB and AM are at least somewhat similar in level... i need someone to look it over.

btw, this messageboard likes to eat messages! i copy my message now before sending... just in case :D.

phil :)

You are talking about automatic volume control - AVC. You should be
able to find many schematics with it.

To be honest, the AF Gain is the one knob on my R75 that is less than 100% satisfactory. For some reason, it seems that at low to mid-volumes, the knob is "jumpy," that is, the volume increases stepwise instead of linearly at a couple of points. This is most critical when using headphones. I think the potentiometer in the knob is bad or dirty, but either way, it is the one problem I have with the radio.

hi Bruce:

i totally agree... the AF Gain seems off. i made up a list of things
i would like to change about my R-75 and plan on moding them in time:

1 - volume control flakey
2 - SSB volume too low
3 - BCB attenuator bypass switch (mod exists)
4 - ECSS filter for fidelity (mod exists)
5 - AM AGC flakey (mod exists)

phil :)

the S-AM mode, but there can still be some bleedover
from adjacent frequencies.
>
> I haven't noticed any bleedover with the 3.8 filter.
> Could you describe it?

Simply, adjacent stuff getting by the skirts of the
filter. The edge of the filter is not absolute, and a
strong enough signal will interfere on S-AM using the
3.8 filter, even with the passband turned away, where
the right sideband will cut it out.

> The 7030+ works the same way as the R75. I've never
> heard anyone complain.

I don't know what the 7030+ does - is it selectable
sideband? If so, then it does not do the same thing
as the R75, which is not sideband-selectable

> The other thing is that on the R75 in S-AM mode, I
> think the radio chooses the better sideband (when
shift == 0) cancelling the remaining one out -- maybe
someone can confirm this?<

No - the S-AM on the R75 is double sideband, and to
reduce one of them, one must turn the PBT to one side.

> > Make no mistake, it is better by far than the

That's what I said :-)...but the modified S-AM on the
R75 is "better by far" than the unmodified S-AM.
That's my story and I'm-a stickin' to it.

> You can have as many filters with similar values in
> the R75 if you so choose.

If you purchase them and put them in the right spots
- but then the PBT only works with the 450kHz IF
filters (the 6 and the 2.4 stock, the 6, 3.8 and 2.4
modified), and not the 455's. For example, if you get
the 3.3kHz 455kHz IF filter from Icom, it will give
you narrower filtration, but you won;t be able to
"passband" those pesky signals out of the way. The
R8B is a bit more agile in this regard.

1378. R-75 VS R8B

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-03-26 00:27:53 UTC
From: atagrasin
Topic: 1378 Message: 1378

HI Bob:Yes a modified R-75 not only performe equal but in some issues surpas the R8B.The R8B fame is a myth,is only a good receiver for program listening.I dispell the myth testing side by side one R8B in perfect conditions with a mod R-75.Remember that the R8B is a 10 years old circuit[of the discontinued R8]with some modifications.I have the opportunity to test some R8B[including a new one]side by side with the same antenna and my mod R-75 win hands down in sensitivity to very weak signals dixing,more clear sound[the R8B sound is too bassy and when you use the tone control you only add "hissybass".There is a lot of birdies and noise [internal generate by the display, wiring and other sources in some frequencies that in some conditions that moved the signal meter to S5.The passport white papers in page 16[an other pages]talk about this flaws and write that the R7[drake old version]in some important things is better than the R8B.This flaws vary with different R8B versions.This Drake run very hot[some owners recomend use a 12v external power supply.About the filter in the R8B, with the kiwa 3.8khz in the R-75 you don't go to have problems .After the kiwa mod you have 6,3.8,2.4 options for your program listening.The sync can be fix very easy or include in the kiwa mods,My R-75 lock the signal and perform ok but with the overall stability and AGC mod[only add 1 cap] of this receiver you don't need to use the sync det too often.The drake PLL flaws in his receiver make the sync det a life or dead issue for the R8B.An remember the Drake no have 2 very clean pre-amps,tunning up to 60Mhz in 1khz increment,and the R-75 have a very god twin PBT and include for free an DSP.With all this features including if you modified it with Kiwa you pay for all only about a total $675.00.You save about $700.00 compare with the R8B [$1,379].Owners of the R8B who spend $1,379 no are go to admit the flaws of his expensive receiver,but I find in a lot of post in googles group and other sites from some honest R8B owners that admit his receiver is no perfect [there is no perfect receiver in any price all have flaws].Bob go and upgrade that R-75 and wait 5 years for see if a truly good receiver appear.with the R-75 the price is not the issue is the performance.If someone tell you the R-75 need upgrades tell him the PRO'S [$5,000] Watkins-Johnson,Ten-Tec-340[$4,000]and other need mod for best performance you see?The R-75 is in good company .

Bleedover? Please describe.

> Make no mistake, it is better by far
> than the unmodified R75, and it is really pretty darn
> good

The sync detector works well on the R8B, if that's what you mean -- I wouldn't say the R8B is better by far. A sync detector shouldn't be needed all that often -- except on radios like the R8B where the sync detector must compensate for drift and large tuning steps. Plus, sticking that audio filter in the path of the sync detector on the R8B cuts off the highs, giving the illusion of good performance, but really cutting off fidelity -- it doesn't sound a little bassy for nothing.

> - but occasionally, there will be that station
> that responds *only* to using the ECSS method (which

>
> Also, the R8B simply has more filters than the
> modified R75

You can add .5, 1.8/1.9, & 3.8 kHz filters to the R75 giving it similar filter options as the R8B (which allows no choice).

> and they can work in all modes. If you
> want to do utility work, you may want to grab another
> more snug filter for the R75.

The only mode restriction there is on the R75 is that the optional filter in then 455 kHz slot (one filter) will not work with the synchronous detector. It's not much of a setback.

> The Drake is also said to have better audio;

This is questionable. The Drake does have a mellow sound with a bass that's sometimes a little dark/muddy -- kind of like tube radios. If you prefer this, than Drake is your choice here. But there's nothing

wrong with the sound of a modified R75 with an external speaker. The
Drake also needs an external speaker to get the best sound.

> this is
> probably largely squared by the addition of either

And the buttons don't stick, and the tuning knob is real nice.

hi Bob:

> Is the performance of the R75 with all of the Kiwa mods equal
> to the R8B?

i would agree with Bruce (hi Bruce!). many of us get the R-75 and will modify it to prevent us from having to spend over $1000 for a receiver like the drake. i use the R-75 mostly for UTEs and this is where the R-75 shines. as far as the S-AM goes i know it is fixable but for me it is of no interest: i use ECSS for AM.

the R-75 is a great receiver, just make sure you have something to gain by getting it: maybe you want a backup unit, or you like that it is small, or you want to take it in the car, or you're into utilities and amateur listening. let me also suggest you consider the AOR 7030+.

.. and you don't think the R-75 doesn't have an audio filter. Look
at IC1211A/B in the schematic. It's there.

Just like the R8B, the filter is in the path for ALL detectors.

I use the R8B's sync detector for cleaning up selective fading. Not
for PLL drift, not for large (10 Hz) tuning steps. I have not seen an
issue with either.

I can't comment on the R8B, but I have my unmodified R75 hooked up to an external speaker, one of the small black hi-fi speakers that Radio Shack sells. Although my R75 is unmodified, I get _very_ nice audio from this speaker: strong bass, solid midrange, and fine treble. In fact, one minor drawback is that due to its good high end response, high-pitched heterodynes (ringing tones) come through very well[1].

Often when people complain about the unmodified R75's audio in AM/S-AM mode, they're complaining not only about the built-in speaker (which is really designed for maximum clarity for SSB voice communications) but also the "pumping" effect caused by the AGC's response to rapidly fading signals. Although I haven't installed any of the AGC mods, I've found that turning off the AGC and adjusting the RF gain to bring in the station can often provide pleasant AM audio for such signals.

Given a good external speaker and some practice with the RF gain control, my experience is that even an unmodified R75 can produce very nice AM audio.

Dave

[1] The R75's stock 6 kHz filter is a little too wide to allow you to tune in a SW broadcast station without also picking up some of the adjoining station's audio: thus the heterodyne. The DSP's ANF feature can get rid of many of them, and the inner PBT knob can often be adjusted to eliminate others.

A lot of talk about 5 kHz AF filters in the R8B and perhaps R75. I don't think this filter is the cause of the bassy sound of the R8B. If you use 4 kHz or 6 kHz selectivity AM you only receive +/- 3 kHz of either sideband. A 5 kHz should make no difference. Most AM stations do not modulate the carrier with frequencies above 4500 kHz, in order to avoid interference to close in channels. The main reason for a 5 kHz audio filter is probably to reject heterodynes from stations 5 kHz away and perhaps to reduce broadband noise from the IF amplifiers.

I use a highpass filter cutting of the bass to get better readability from my R75 and R71. A high frequency cut off is not needed for the R75. It is very quiet. No hiss in the audio

My $0.02 worth - with the Kiwa mods and that $20 Radio Shack speaker, the darn thing holds its own easily on AM. I hardy ever use the ECSS method anymore for AM, except in situations where the desired signal is so weak compared to adjacent powerhouses that it is inaudible in AM. I am in California, and some that come to mind are the wee Canadian local stations in the 49 meter band. SSB and PBT bring 'em right on out.

Simply, interference from adjacent channels...if
you've listened to any HF radio, you have undoubtedly
heard this. Sorry for the jargon.

> > Make no mistake, it is better by far than the
unmodified R75, and it is really pretty darn good<

> The sync detector works well on the R8B, if that's
> what you mean --

Not exactly - in this line of thought, I wasn't
referring to the R8B at all, just the modified versus
unmodified R75. The modified is better *by far.*

> I wouldn't say the R8B is better by far.<

I don't know - I've never used the R8B...but it does
have selectable sideband S-AM, which is theoretically
better than using regular S-AM with the PBT to isolate
the signal (like the R75).

> I'd bet A sync detector shouldn't be needed all that
often -- except on radios like the R8B where the sync
detector must compensate for drift and large tuning
steps. Plus, sticking that audio filter in the path of

cutting off fidelity -- it doesn't sound a little
bassy for nothing. <

I agree - I don't need to use the sync detector that
much, although it is handly occasionally. The Kiwa
AGC and filter mods have been far more useful.

(which allows no choice).<

Yes, and (except for the 3.8 - did you mean 3.3?) then
you add $150 or so for each filter, none of which (if
I read the specs right) can be used with the PBT or
S-AM because they are in a different IF chain.

> The only mode restriction there is on the R75 is
> that the optional filter in then 455 kHz slot (one
filter) will not work with the synchronous detector.
It's not much of a setback. <

PBT too - and I beg to differ. I like to have
everything working with everything else, and I use all
the possible combinations too. I think it is a
drawback, and I am thankful that the Kiwa mods help to
square that inequity (shame on Icom for such
silliness).

I'll go along with this - my R75 modified sounds just
dandy - no complaints.

Yeah - beautiful sensuous feel ;-) and the display is gorgeous.

What bandwidth is the R75 audio filter? It cannot be
very narrow if it has to pass auidio from the 15kHz FM
signals...

When my R75 was unmodified, I found the above to be true for SSB but not really for AM. The ANF helped a bit, but it is not the last word on het removal; the PBT was almost useless on AM without an intermediate filter - the 2.4 was still too narrow (although I used it), and the 6 was just too wide. The Kiwa 3.8 has become my filter of choice for almost every station now, except for in-the-clear powerhouses, which are not too common.

Switching to SSB was essential without the modifications. Now, it is a once-in-awhile thing.

Good day!

The R8B uses a phase shift network (PSN) to cancel the unwanted
sideband. I do not know which method (PSN or passband shift)
eliminates more of the unwanted sideband -- here, we need some tests.

The 9 Mhz IF filters are cheaper as is the 3.8 Kiwa filter.

> silliness).

All the filters mentioned above (.5, 1.8/1.9, 3.8-Kiwa) can be used
with the passband tuning -- try it. And all except the filter
installed in the 455KHz slot (you could put the 500 Hz filter here)
work with the sync detector. If you wanted to maximize the filters

that you can reasonably use with the sync detector (and PBT), then install the 3.8 Kiwa filter and the 2.8 kHz 9 MHz IF filter. Then, your choices for filters for the sync mode would be: 6, 3.8, 2.8, and 2.4 kHz. That's quite a lot of choice and all except the 6 kHz filter are affected by the passband tuning.

HI Phil:WE don't modify Our's R-75 to prevent us from having to spend over $1,000 for a receiver like the Drake.I have the R-75 with mod's because it surpass the drake in performance and I am posted about this all this year in different groups.If someone don,t have put side by side the two receivers,for him very difficult to understand how a $550.00 receiver with some mods go to surpass a $1,400 receiver with a super propaganda and advertaising backup.The "myth" of the R-8B keep alive in you words "many mod the R-75 to prevent to having to spend over $1,000".Go mod your R-75 and dispell for yourself the Myth.

> to the R8B?

i would agree with Bruce (hi Bruce!). many of us get the R-75 and will modify it to prevent us from having to spend over $1000 for a receiver like the drake. i use the R-75 mostly for UTEs and this is where the R-75 shines. as far as the S-AM goes i know it is fixable but for me it is of no interest: i use ECSS for AM.

the R-75 is a great receiver, just make sure you have something to gain by getting it: maybe you want a backup unit, or you like that it is small, or you want to take it in the car, or you're into utilities and amateur listening. let me also suggest you consider the AOR 7030+.

You know you are addicted to the icr75 when you are trying to work your love for the radio into your wedding vows.

You know you are addicted to the 75 when you take the day off because there is a new post from RADO or PHIL.

You know you are addicted to the 75 when you hook it into your wireless lan so that you can hear it all around the house.

You know you are addicted to the 75 when you cover it with a towel each night while the 535d and the 800 sit exposed.

You know you are addicted to the 75 when you schedule a radio-sitter to come over and turn it on once a day while you are out of town.

You know you are addicted to the 75 when you buy another one to take with you when you are going out of town.

You know you are addicted to the 75 when you take the extra one you just bought out of town on your honeymoon.

You know you are addicted to the 75 when you lean over to smell the fresh electronic component wafting during break in or you save the box just to sniff that new radio smell now and then.

You know you are addicted to the 75 when you secretly love the fact that it beats all other radios this side of a modified ic-r9000 with sherwood se3 for over ten grand.

Ok there is my list anyone else want to pipe in?????????

Phil number 2

It's not an isolated case you experience.
My R75 has the same problem.
I listen a lot on my headphones, and it's a pain in the *** to get the
volume right.
It jumps from zero to relatively loud on the headphone, there's no in
between.

This seems to be a good idea. There are such systems for hams.
Check, for example, www.dx-central.com. It allows anyone to post
a "spot" in real time so that other hams can tune to it and work a DX
station. Not sure if something like that exists for the broadcast
bands.

To be honest, the AF Gain is the one knob on my R75
that is less than 100% satisfactory. For some reason,
it seems that at low to mid-volumes, the knob is
"jumpy," that is, the volume increases stepwise
instead of linearly at a couple of points. This is
most critical when using headphones. I think the
potentiometer in the knob is bad or dirty, but either
way, it is the one problem I have with the radio.

i agree and this should be able to be resolved. the R-75 seems to
have a *great* main RF section, the flaws are later in the chain like
at the AM chip (RADO mods) etc. in a way, we are somewhat fortunate:
the audio section is a lot easier to work with than the RF section.

Hi, Dave - Well, that's a fine idea, except (1) it
does diminish the sensitivity, and (2) something as
simple as a volume control ought to work right, right?

Getting the S-AM wrong is almost forgiveable; screwing
up a volume control, however, is grounds for execution
in some countries.

Oops ....
Let me correct a bit the half answer . It has been writen and half and forgotten

An idea.
> You can do a tunable attenuator to your heads as follows:
Use a jumper (bridge?) cable twin and shield and on the hafp of it you can
insert a twin pot in series with the one end connected to shield
Both cable ends should have connectors (one for the phones radio output and
one for the earphones)

I have made one cable set for my vinyl LP player and its Terratec phono
peramp for my computer and it worked.

1408. Did some alignment (Re:You know you are addicted...)

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-02 12:48:43 UTC
From: Radostin Danev
Topic: 1408 Message: 1408

Hi Phil & Phil :-),

The "you know you are addicted" list gave me a good laugh too. Thanks Phil.

> lol. speaking of which, where is RADO? :(

I am here. Just little busy. This past weekend I had little time for my R75. Tried the adjustment procedures from the service manual (file "Alignment procedure.pdf" in the Files/Information section). Performed the procedures in section 4-3 "Receiver sensitivity" & "1st Mixer balance". As a signal generator used the LO oscillator of an analog single conversion Sony portable (don't remember now the model ... maybe it was ICF-SW10).
My procedure was as follows:

0) Turn on the radio and leave it to receive something for about an hour. This is to warm it up.

1) Connected the signal gen to the ANT1 input. Cable with clamps - coax shield to the ground of the Sony portable, center of the cable to the telescopic whip of the Sony. This gave me a nice S9 signal from the LO of the portable.

2) Set R75 to 14.100 MHz, USB, 2.4kHz/9Mhz 2.4kHz/455kHz, and adjusted the tuning knob of the portable until the LO was at 14.00150 MHz. This was little bit tricky as the tuning is not very fine - but finally I did it.

3) Connected AC millivolt-meter to the "Line out" ("Rec out") of R75. This was a digital multimeter set to "ACV".

4) Turned off the AGC of R75 and adjusted the RF Gain manually until the millivolt-meter showed about 300 mV AC (the rms of the 1500Hz beat audio tone). Keep the AGC off during the following adjustments.

5) Made a non-magnetic screw driver from a wooden pick.

6) Adjusted the cores of coils L443 to L911 (in order as listed in the service manual) for maximum signal on the millivolt-meter.

7) Performed the "1st Mixer balance" adjustment. Turn off the portable (signal gen). Set R75 to 0.030 Mhz (I used this instead of 0.100 Mhz as described in the manual), USB 2.4kHz/2.4kHz. Adjust in turn coil L443 and R444 (to access this you'll have to open the can of the 1st mixer) until the lowest noise level was achieved. Actually around 0.030 MHz you'll hear some spurii from the DDSes - I used the strongest one and succeeded to diminish it completely after some fiddling with L443 and R444. This also reduces the noise.

8) Repeat the sensitivity adjustment as in steps (1,2,3,4,6). Do not touch L443 this time!!! Leave it as it is after the 1st mixer balance adjustment. Adjust again the cores for maximum signal on the AC voltmeter.

9) Done.

I can say that I achieved marked improvement in the noise (reduced) below 0.100 Mhz. Also the cores of some of the coils in the sensitivity adjustment were far from the optimal position. I think I felt the radio perform better after the alignment - but this is very subjective. Theoretically it should be a tad more sensitive and a tad less noisy.

Best regards,

Rado

1410. NON-MODIFIED STOCK R75 SYNC-AM

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-03 13:37:05 UTC
From: icomfandan
Topic: 1410 Message: 1410

Hello,

I am familiar with all the hoopla about the "non-functional" Sync-AM detector in the R75. I just wondered if anyone has tried using an unmodified R75 in non-auto sync mode? This seems to work just fine, certainly a whole lot better than it does in "auto" mode!

To try this, simply go into the set menu and scroll until the "SAM SW" sub-menu display appears. The factory default setting is "En", which is the auto-mode setting and the one that has little or no effect. Turn the tuning knob to change the "En" to read "SA", then exit the set menu.

Now, tune an AM SW signal, select S-AM with the AM mode button and hear the difference! When you tune up and down the band, you can hear the sync "whistle" as it locks and unlocks with each passing signal. The effect is very noticeable, in comparison with the factory auto-mode setting.

You just might find that it works well enough for your needs, without resorting to all the mods. This leads me to wonder if most of the R75's sync-detection "problems" stem from the implementation of the auto-mode parameters, and not with the sync detector itself? There certainly appears to be a BIG difference in performance by just using the SAM SW in the SA mode.

I have owned three R75's now, the last one I had was modified per the info available from this group. However, in all this time I never used the menu to change the sync-mode operation characteristics. I've even constructed the latest LM339-based mod board for installation on my new R75, but after trying this simple and non-invasive adjustment, I think I may just leave well enough alone for this time.

I invite those of you in the group with unmodified R75's, to try this simple menu adjustment FIRST, before deciding on further expenditures of money, time and effort.

Just my nickel's worth...hope this helps!

I tried this based on earlier advice in this forum. It might help a little, in particular if you reduce the RF gain. But reducing the RF gain helps just about as much even if S-AM is off. At least you know it is doing something because you can hear the beat tone. But neither of these things works nearly as well as ECSS with the wideband SSB filter - $150 and you don't have to mail off your radio or void its warranty.

IcomFanDan,

That's one of the first things I did. I tried
S-AM both ways, with RF adustments.

I'd rather stick with ECSS via SSB or CW
modes.

Maybe you got lucky - I tried this, and nada. The
S-AM didn't do much on either the SA or En setting,
either switched on or off.

With the Kiwa mod, it works great!

OK... "squawk... screech... howl..."

Nope... doesn't cut it. :-)

Icom will never acknowledge the SAM faults. They've sold too many to commit to any fix. They have a habit of doing dumb things. For instance- the IC-718 HF rig... same "box" as the R-75... 160-10... nice rig... BUT! They left out FM rcv and xmt (for 10 meters). Totally idiotic. This is nothing new- they've been doing this sort of thing since Day One. Their elevator never goes to the top floor.

Hello,

I am familiar with all the hoopla about the "non-functional" Sync-AM detector in the R75. I just wondered if anyone has tried using an unmodified R75 in non-auto sync mode? This seems to work just fine, certainly a whole lot better than it does in "auto" mode!

To try this, simply go into the set menu and scroll until the "SAM SW" sub-menu display appears. The factory default setting is "En", which is the auto-mode setting and the one that has little or no effect. Turn the tuning knob to change the "En" to read "SA", then exit the set menu.

Now, tune an AM SW signal, select S-AM with the AM mode button and hear the difference! When you tune up and down the band, you can hear the sync "whistle" as it locks and unlocks with each passing signal. The effect is very noticeable, in comparison with the factory auto-mode setting.

I tried this and you are right there is a very noticable difference in performance on the weak or fringe AM. Thanks for the update

Jeff

If you want a good sync detector for $500, get a Grundig S800 or a Lowe HF-150 (are these still around?). The R-75 is not the optimum program listener radio but it is the best bang for the ruble re: Utes and DX. IMHO, natch.

"If you want a good sync detector for $500, get a Grundig S800 or a Lowe HF-150..."

Hi Dave,

I was thinking about the Lowe unit before I decided on the R75. When you say 'good sync detector', does that mean 100% no selective fade distortion?

Do you or anyone know if either units tune with 1Hz resolution like the R75? (That's why I stayed with ICOM, knowing I would want this tuning resolution for ECSS, just like the R71A.)

:)

I tried this before getting the Kiwa mods done. Your right about one thing, you can here the whistle when you reach either edge of the +-3kHz limit of the sync detector's range. However, it still had a negligible affect on actual fades. This can be explained by the fact that the unmodded sync detector never leaves the "tuning mode", i.e. it never switches to a narrow operating width, and hence the error in frequency between the synthetic carrier and the actual carrier can be quite large rendering it ineffective on fades. The Kiwa mod does fix this.

8 Hz on the Lowe. I don't have a Sat 800, but my Drake SW2, a similar design, is 50 Hz steps.

"If you want a good sync detector for $500, get a Grundig S800 or a Lowe HF-150..."

Hi Dave,

I was thinking about the Lowe unit before I decided on the R75. When you say 'good sync detector', does that mean 100% no selective fade distortion?

Do you or anyone know if either units tune with 1Hz resolution like the R75? (That's why I stayed with ICOM, knowing I would want this tuning resolution for ECSS, just like the R71A.)

:)

Hey, save me a seat in fogeydom will ya? I agree, I
don't understand all the sync worship either. I tune
international broadcasters in ECSS with the stock wide
SSB filter and an external speaker and enjoy great
reception. I am glad ICOM put the engineering into
more important things. And, I am not about to tear
into the rig and make mods or spend the money and send
it off to Kiwa for little, if any, benefit. I think
sync detection has just become the fad of the day for
people who have been programmed to expect everything
to work at the push of one button. But, then again, I
grew up with the radios of the 60s too, so I can
appreciate the level of technology the R75 really
represents.

Good listening.

PWBR is annoyingly opinionated sometimes (but look who's talking!). I think they're mad because you can't plug a Sherwood SE3 into the R75. I have 2 Drakes and a Lowe that I can use for "HiFi" program listening. When I want to hear CG aircraft operating over the North Atlantic (I'm 30 miles North of Los Angeles) I'll use the ICOM.

Lowe HF150 is only a basic communications receiver but does not have the 1 Hz resolution. It only has a kHz resolution .
BUt surely the synch detector is very good. I can only a few times find it not working , especially in very strong fades

Please read my html file included in this message. I m not sure if this page has been uploaded to my web site

The display shows 1 kHz. Steps indeed, but the actual tuning steps are 8 Hz in USB, 60 in AM.

Hey frscistercian, why are you so critical of people who find fun and personal challenge in hacking R-75's S-AM? BTW, you have to buy an expensive wide SSB filter to make ecss fidelity comparable with AM, while it costs only $10 in radio shack parts and a few hours of soldering to make a decent S-AM.

I am not critical of doing mods...that's cool.I just don't get the
obsession with syncro am.Many people seem to beleive that without
sync a rig is somehow 'second rate'.I find that notion silly.My
favorite rigs dont have it.But I mostly chase milcom and
utilitys....so I admit some bias in that regard.

1435. R75 audio quality

Yahoo group: icomr75 (2000 — 2002)

Why is everyone so hard on the R75 audio, and AF section in general?

I bought a pair KOSS PC multimedia amplied speakers model SXM30 and use them, and I gotta say I think the audio is fantastic!

Put it this way notonly is this my DX radio, but when im listening to my Local MW news/chat and music ABC station, this is now the radio of choice. As such the R75 is on all day evry day...

Also I find the volume control is fine, both thru the speakers or phones, I have never even thought it steppy or had trouble with right volume leverl. Could be speakers/phones are not a god match for the rig, if you cant find right audio level.

Topic: 1435 Message: 1436

On Fri, 5 Apr 2002, Jem Cullen wrote:

> Why is everyone so hard on the R75 audio, and AF section in general?

I think folks are complaining about the rather poor performance of the R75's AGC circuit on fading signals, especially those which rapidly fade in and out. If the 25M or 19M bands are coming in after dark, they are often full of such signals. Whether the AGC is set to fast or slow, such signals often cause a rapid "pumping" effect as the AGC tries to keep the volume stable as the signal fades in and out. As I understand it, the R75's AGC time constant is not well suited for rapidly fading AM signals; instead, they were chosen with SSB audio in mind. There are mods which are supposed to correct the AGC time constant to eliminate the "pumping". I'm not clear on what effect if any these mods have on the AGC in SSB mode.

Thankfully, the stock R75 has a workaround for the problem: if you turn AGC OFF and adjust the RF gain knob until the S-meter's reading is "stuck" at the same level where it peaks when the AGC is on, you'll often end up with very nice and stable audio without "pumping". Once I got the hang of this technique, it became so easy that I've seen no need to perform any AGC mods.

> I bought a pair KOSS PC multimedia amplied speakers model SXM30
> and use them, and I gotta say I think the audio is fantastic!

I have a single Radio Shack (aka RCA) minispeaker plugged into my R75's external speaker jack. I think the audio is very, very good. Unlike the R75's internal speaker, this speaker actually has some bass, but ham QSOs and other voice-only program material sounds fine, too.

> Put it this way notonly is this my DX radio, but when im listening
> to my Local MW news/chat and music ABC station, this is now the
> radio of choice. As such the R75 is on all day evry day...

Like you, I've found that the R75's MW audio is very good. In fact, the fact that its audio with local MW stations is so good helps to confirm that the radio's audio problem has to do primarily with the AGC circuit. After all, local MW stations come in via groundwave rather than skywave propagation, so they don't suffer from fading.

hi Dave:

> As I understand it, the R75's AGC time constant is not well
> suited for rapidly fading AM signals;

my understanding is that the AM chip has its own AGC and it is set to 'fast' which negates the button setting on AM. the mod (capacitor) is soldered directly to this AM chip.

i agree with your work arounds. i have not moded my R75 (yet) and plenty of problem can be solved via learning the R75's quirks... this is what harry helms suggested in his book. R75 users are lucky: we have a big arsenal of features, great user community, and plenty of mods. life is good ;)

phil :)

1443. Antenna questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-06 20:20:50 UTC
From: kd7hcw
Topic: 1443 Message: 1443

Hi, proud new owner of an R75. Been reading this group since I ordered it -- this is a great group!

I'm going to be setting up a 75'-100' longwire antenna (inverted-L), and had a question about the connection to the radio.

Is it better to use a balun to go to 50ohms and connect that or just to connect via the longwire connector? The manual says the 50ohm is for a Yagi, so I was thinking they were recommending a longwire should just go to the provided connector.

Also, on the feedline, is it critical to use standoffs from the building? If I don't, is the risk interference or static discharge?

What about burying the feedline? I'd like to place the antenna some distance from the house and the best way for me to run the feedline would be to bury it.

Thanks for the help, and I look forward to being an active member!

-Lou

1444. RE: [icomr75] Antenna questions

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-06 20:33:41 UTC
From: T. Harding
Topic: 1443 Message: 1444

I purchased an antenna tuner when I ordered my R75. I don't use it. My longwire works just fine going into the wire antenna connector on the back. I'm not using coax on the longwire It runs from my radio, out underneath the window, and over to a tree. When I put my dipole up, I'll use the 50 ohm connector.

It depends entirely on the amount of local electrical noise at your location. The part you call "feedline" is actually the antenna also, so don't bury it. I just use surplus Teflon insulated stranded wire (one piece for the whole thing). Out through a vent, wrapped a few turns around a few screws under the eaves, to a 27' mast, right angle to the far corner of the yard. About 125' Total. Works great. If you want to use co-ax, read up.

1446. FL-102

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-06 21:48:58 UTC
From: Sarmento Fernandes R Campos
Topic: 1446 Message: 1446

Hi

I have just added a FL-257 filter with good results, specially when listening broadcast throught AM mode.

But I think there is a gap between this one to the stock 15kHz, so how could we effectly install a FL-102 in the second 9MHz position, since the menu does not list this option ? Is it necessary to replace the stock with this one so it would not necessary make any config setup ?

Could someone please detail this ?

Best regards,

Sarmento Campos

To avoid introduction of distortion and noise you should use the
50 Ohms connector since you can use coax cable to the outside and place
your antenna away from any tv-set, computer and other devices inside the
house. A magnetic balun works great with all kinds of longwires.

I use a 140ft windom(like a longwire but fed 20% off one end, and the line comes straight into the window with a lightning arrestor connected to a good ground.You cant bury a single wire feeder without losses and noise introducion so if you must bury the line use good quality coax and a balun at the longwire.The balun and coax are pricey (compared to plain wire).A loop of wire connected to the coax directly may suprise you.As an experiment I built a 9 x8 foot loop on one wall of the shack with magnetwire.Coax feeds the 50 ohm port of the radio.I am amazed at what I can hear with such a modest antenna (Chinese Volmet,new zealand volmet, tokyo volmet etc on 13282 and 13285).Noise is low and I plan to erect a much bigger version outside.

1450. Re: longwire antenna

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-07 19:25:31 UTC
From: Eddie Bryant
Topic: 1450 Message: 1450

Hello Lou,

Welcome to the R75 Group and I think you will be really pleased
with the performance of the R75 and especially if you go
with an external antenna as well.

> Is it better to use a balun to go to 50ohms and connect that or just
> to connect via the longwire connector?

At minimum I would use coax from the rear of the R75 (antenna 1)
until it gets outside of the house. Even further would be great as
your post suggested you will be placing the antenna a distance
aways from your house. The coax will provide shielding against
interference from many household items as it makes it way through
the home. RG-8X or RG58 coax is probably just fine. There are
many types of coax and your can spend alot or a little. I use RG8X.
Soldering up one of these PL259 connectors is a chore and requires
a great deal of heat from a soldering iron. You may be able to find
these cable assemblies preassembled to the legnth you need if you
do some looking around.

> Also, on the feedline, is it critical to use standoffs from the
> building? If I don't, is the risk interference or static discharge?

Standoffs you are refering to are only necessary on the ladder line
twin-lead (300 ohm TV type) feed-line. Especially when in
proximity to metal objects. This type of feed line is desired by some
Ham Operators but for your R75 coax should work fine. Coax is
unaffected by the metal close to it.

A good ground would be important since you are going to have this
giant piece of metal up in the air. A ground from the radio chassis
to an 8 foot copper ground rod closely outside should work. Again
this needs to be close to the radio. You could use your copper water
pipes for a grounding point if that is what your house has. Most now
use PVC. You also may want to ground the coax before it enters the
house to the same ground rod or point the radio is connected to. Also
I might also mention that the wall outlet ground is not sufficient for this
type of radio/antenna ground.

> What about burying the feedline? I'd like to place the antenna
> some distance from the house and the best way for me to run the
> feedline would be to bury it.

There are specific coax cables that are made for burying. You also
could run an underground conduit to snake the coax through. This
would be the most desirable as coax will age and need replacing

eventually. Plus you would not need buriable coax then.

Here is a neat link that details some of the questions concerning
Shortwave anteannas:

http://www.rnw.nl/realradio/practical/html/antenna_advice.html

Good Luck with your radio and antenna !

1451. FM Mode - Help

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-08 00:36:27 UTC
From: homer9600
Topic: 1451 Message: 1451

I know this must have a simple answer but how do I access the FM Mode.
I have followed the instruction book, however when I press the FM
Mode button the radio merely remains on the same frequency and all I
hear is a bleed-through of whatever SW frequency I was on.

Can someone explain this to me - I must be missing something.

Thanks.

Your radio doesn't receive the 87.9 to 107.9 mHz FM band. It switches to FM demodulation on whatever frequency you are tuned to. FM Phone transmissions can be anywhere, but 26 to 60 mHz is most likely. Try 59.75 mHz if you have a CH 2 TV station anywhere nearby. Below that is the 6 m amateur band. A lot of State Police transmissions are around 40 mHz.

From: Gert Nilsson
Topic: 1455 Message: 1456

Hallo Phil!

I have both filters and use them for ECSS. Both works great. Better fidelity than the standard 2,4 kHz filters. When you recieve SSB the standard setting is about -20db point of the filters. In ECSS you probably want a little more low frequency audio and adjust the PBT to perhaps the -6 dB point for the carrier. With the 2,8 kHz filter you don't have to use the PBT when changing sidebands.

1458. R75 XL manager

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-09 02:57:06 UTC
From: Radostin Danev
Topic: 1458 Message: 1458

Hi R75ers,

Inspired by this wonderful XL app:

http://www.arachnoid.com/easytuner/index.html

Yesterday I made some lame (my first) attempts with MS Excel and VisualBasic. The workbook I am uploading in the files section is a simple memory manager/tuner for R75. Excel provides great tools for sorting, filtering and managing frequency data.
Let's make this a public domain project of this group. If there are some Excel/VisualBasic gurus here - please help. I have some success with filtering the ILGradio database for "now on air" frequencies. Also I will add a "remote scan" i.e. to scan a list of frequencies directly from Excel.

Feel free to play/modify/improve the workbook. Ideas and suggestions are also welcome.

Best regards,

Rado

1459. Some thoughts

Yahoo group: icomr75 (2000 — 2002)
Date: 2002-04-09 03:51:23 UTC
From: Radostin Danev
Topic: 1459 Message: 1459

I had this thought yesterday ... Why Icom is not introducing an IF DSP receiver? To Like their PROII without the transmitter part and some small modifications to the firmware to make it more suitable as a receiver. Maybe R75 sales are still going well. But such receiver will be placed between R75 and PROII in price (like $1200 to $1500) - so I don't think it will harm the R75 sales. Or there is no market for it? How about "open firmware" DSP receiver. I know Icom is not great sharer ... just a dream. How about PC-based IF DSP receiver. The final IF (for example 13kHz) is fed to the sound card and the DSP processing is done on the PC.Something like this could be done with R75 - use the widest SSB filter setting and feed the audio to the sound card. PCs are fast enough nowadays.

What do you think?

Rado

1460. Re: Some thoughts

Yahoo group: icomr75 (2000 — 2002)

From: just_rtfm
Topic: 1459 Message: 1460

hello there Rado!!!

i have thought the same things! (my second hobby is dreaming) a few months ago i sent ICOM America a letter about making a DSP IF receiver. i told them that to reduce R&D just remove the transmitter section off their 746 Pro or 756 Pro II and market it, same box, etc. they said they were passing the idea on to corporate ICOM in japan.

it may be possible that the 718 (R75) are next for getting a DSP IF: ala R75 Pro. although i suspect ICOM feels that low cost is the better alternative in this market. if it costs too much it will compete directly with drake and 7030+ where people want conveniences like sync detection. (makes me wonder what passport will say about the RX-350) IMO ICOM feels this feature is superfluous.

if ICOM cared about the feature they could just hire a skilled technician to mod the units as per your pdf before they leave the factory. i have to think this would be very cost effective... with a rework station a person could do a lot of units in an 8 hour day! especially if they were a contract worker with no benefits etc. however, if these minor flaws are what is keeping the cost down then i hope their next receiver's sync detector is busted too :D.

IMO having a DSP IF must be nice but nothing is wrong with two good filters... one for AM or ECSS and one for ham. i think we can see this with the 746 versus 746 Pro... the DSP adds a lot of cost ~$700 (i believe) but i am not so sure what you gain is worth it. i could get some killer 'normal' filters for much less. plus good DSP's add expense, programming them adds expense, and the firmware adds gray hair to programmers... i am sure the people at TenTec would agree.

i too have dreamed about an open firmware DSP receiver. i am much better at programming than electronics. yes, use the computer for the DSP! occasionally i use DSP software for filtering and processing power is never a problem. i think your idea is great and i wished TenTec would have done this. they could have brought the cost of a professional receiver down by using the PC to do the DSP work. a black box for $700 that can hang with the RX-340... now that would be cool! i do not think this would be 'that' hard for them. at that price you could buy a $500 computer to run it with still only pay $1200 total.

phil :)

1461. Re: Some thoughts

Yahoo group: icomr75 (2000 — 2002)

From: rsakabu
Topic: 1459 Message: 1461

Quite honestly, unless Icom puts considerably more effort into the IF DSP, it won't be worth it and the consumers (especially self-appointed "expert" reviewers) will blast them for it. I have a 746 (non-Pro) and I cannot say that the receive portion of the radio is any better than the R-75. There are more features like the simple bandscope and graphics for the TPBT, but the IF DSP doesn't do any more than the R-75, or to put a positive spin on it, the R-75's AF DSP is just about as good as the 746's IF DSP performance.

Both do an excellent job at ANF (really helpful when knocking out Lids who tune up on a QSO, or a nearby broadcast station on 40 meters) and both are mediocre at reducing noise with the NR function. The 746 is a tiny bit better simply because the NR is "continuously" variable rather than in steps, but the RF gain does a much better job at reducing atmospheric hash on SSB than the NR.

Now if you want a really "killer" receiver, get a 756ProII, don't plug in the mike and add an external speaker (you'll also have to get a C-IV converter if you want computer control). The steeper filter skirts, the realtime bandscope and the TFT display would make that the ideal receiver for me. Unfortunately, I don't want to spend $3000 for it and I doubt Icom can make it for anywhere near $1000.

Oh well, at least we can dream.

These were exactly my thoughts - why not make a receiver from the 756ProII
by taking out the transmitter. This should reduce the price. I think they
can sell it in the range $1200 to $1500 - no R&D costs, small or no
modifications to the ProII production line tools.
It is realistic ... I was wondering why Icom is not taking this step.

Best regards,

Rado

If they really sent it I hope the person who receives it at Icom Japan can read English. This is a problem here. If he cannot understand the message - he will simply ignore it. They never admit they do not understand something. This is coming from their writing system - the Kanji's. When I give somebody something to translate me and he is not remembering the meaning of some kanji's he tries to guess the "missing" words. Sometimes this leads to an erroneous translation. Not knowing the kanji's speaks bad about a person - it is like being non educated. That's why they never admit they do not understand. Go figure ... sorry for the off-topic foray ...

OK - they keep R75 as low cost alternative and release R76 (756ProII receiver) as competitor to AR7030 and Drake. The synch has to be added to the firmware of course.

> if these minor flaws are what is keeping the cost down then
> i hope their next receiver's sync detector is busted too :D.

:-) Yeah, but if these are firmware flaws in an IF DSP receiver - count me out of the mod team. :-)

> IMO having a DSP IF must be nice but nothing is wrong with two good

I agree here. I had a 756 which I used as a receiver before I got the R75. Real filters sound more "natural" more "easy" on the ears/brain.

> if TenTec would have done this. they could have brought the cost of a

Maybe one day we will see such thing ... if the shortwave is not dead until
then :-). This market is so small ...

Best regards,

Rado

hi Roy:

nice post! do you know if the 746 Pro is any better than the 746? practically speaking. i have read a few people's post that the Pro version wasn't really worth the extra money.

btw, i was under the impression that the NR /is/ continuously variable from 0-255 (one byte) but the numbers are only advanced every 16th positions... sorta like the backlighting. when you go to program it there is a one byte value (pumped out as BCD) also.

is the 756 Pro II really worth it considering you could put some killer filters in the R75 for that kind of money? for what i do i would almost rather have the R75 with one really good collins filter than the DSP. just some thoughts. :D

phil :)

"Real filters sound more "natural" more "easy" on the ears/brain."

Not all DSP bandpass filters are harsh. My MFJ 784B is pretty easy to listen to. Not a lot of objectionable artifacts. I use it with a Drake SW2. Has anybody tried to remove the tones from WWV with the 102?

hi Rado!

i thought the same thing about them sending my suggestion to japan... i hope they understand it! i thanked Mr. Inoue in japanese. btw, i was going to ask if you were in japan (e-mail addy)... i have always wanted to go there! do the people like Americans?

i bet the sync will be left off of firmware because IMO ICOM equals amateur (ham) and shortwave is just a side gig... which is why they might go for cutting the transmitter off the 756 Pro II and selling! save some R&D cash. they could do this: dump the R75 (and the 718... i know: blasphemy!) and use that team to take off the transmit sections of the 746 Pro and sell it for $900. hot cakes anyone? :D

> Real filters sound more "natural" more "easy" on the ears/brain.

i have heard this from others. it seems ironic... you can make a perfect 'brick wall' digital filter but in the end you shape them after the real 'flawed' ones :D.

> This market is so small ...

my impression is that companies like TenTec and ICOM have the best chance at survival because of their ham roots. if all the shortwave broadcast transmitters stop tomorrow, some of use can move to mexico to transmit and keep the sport alive. :D

nice to see you posting Rado... we have missed you!
phil :)

From what I hear on the 746 and Icom mailing lists, no, the 746 Pro would not be worth the extra money. A very good indication of this is seen when taking a quick look at the used 746 market. The price has not dropped very much since the arrival of the 746Pro meaning that:
a) The 746Pro is not worth dumping your 746 and shelling out the difference between a used 746 and a new 746Pro.
b) The current 746 owners are looking for the best bang for the buck and the old 746 is still a perfect fit for them.

On the other hand, if you look at the used market for many of the "bleeding edge" top of the line rigs, as soon as its replacement comes out, the market gets flooded with the previous model and the used prices drop 20-30%.

The new features of the 746Pro include the choice of steeper skirted software filters, built in TNC interface (you still cannot control the rig directly with RS-232 like you can with the R-75, you'll need a C-IV control cable), variable noise blanker, manual notch filter (so you can remove a heterodyne without losing your CW signal), and selectable AGC time constants. Gone is the choice of optional crystal or mechanical filters. The 746 let you add up to two 9 MHz filters and one 455 kHz filter. This let you experiment with Icom, Inrad, Collins mechanical or whatever filter you wanted. The 746Pro doesn't let you put any additional filters in, they say the DSP choices are all you need. This maybe better, maybe worse, but certainly no choice.

The simple bandscope on the 746Pro is the same as on the 746. It mutes the receiver while it scans the frequencies and displays what's essentially the S-meter readings in each slot. That's where the 756Pro really shines, the scope is realtime and you can see what's out there while still listening. But the 756Pro/ProII does not let you add additional filters either :(

LOL. The enhanced display alone is probably worth $1,000 (retail).
If the IF DSP NR and ANF aren't big improvements over the AF version,
them I don't see the point. Perhaps Icom should just improve the
R75's sync detector and add more slots (and logic) for REAL filters.
Increasing the range of the passband tuning wouldn't hurt either. Just
my 2¢.

If any of you have a chance to personally get into an amateur radio store such as Ham Radio Outlet or AES, by all means get into the store and try out some of the "big gun" transceivers! Let the store people know that you are not a ham, but want to check out the receive section of the radio, that you are aware that it is not legal to transmit without a license and you have no intention of doing so.

Many of the best receivers are found on ham radios. For 90% of the amateurs out there, the cheapest, most basic transmit section will cover almost their needs. What sets the most expensive rigs apart from the "entry level" ones are the receivers and its receive features. Most hams spend more time listening (*hopefully*) than talking. I personally would rather have a great receiver and an "adequate" transmitter than studio quality transmit sound and a clock radio quality receiver.

Some of the older transceivers make excellent receivers. Most need the help of an external speaker even for amateur and utility listening (those top firing speakers stink). I've been playing with a Kenwood TS-940 and the operation of the rig and the receive quality is incredible. On Friday, I participated in a net on 20 meters and there was another conversation that started up which was centered 1.5 kHz above our frequency at about S7-S9. With the 940's TBPF, I cut the "monkey chatter" out completely and only lost a little of the top end sound of the other stations. On other radios, I've had a hard time with signals twice as far away. The sortwave broadcast receive of the radio is also top notch and by using ECCS, I had no problem with its lack of sync detect.
